# Placer County Awake

THE editor of the Cultivator met last week with the fruit growers of Placer county, who have awakened to the necessity of bettering fruit marketing conditions. This county has the reputation of producing some of the very finest peaches grown in the world. It is pre-eminently a peach section, although many other varieties of fruit are grown to perfection. During the past season, this fruit proved to be of a lower grade than in preceding years. This, with most unfortunate marketing conditions, combined to give growers a very severe lesson. One cause of the lowering of the grade has been the omission of spraying for the peach worm, resulting in a large amount of wormy fruit. Some of it was culled out, but much went to market. One lot rejected in Seattle was found to contain over fifty per cent of this inferior fruit.

During the meeting the responsibility for shipping this class of fruit was passed back and forth from grower to shipper and from shipper to grower, but there was no effort to sidestep on the question of never allowing the same thing to occur again. Both shippers and growers, and some who are both growers and shippers, were unqualified in their condemnation and in their determination to allow hereafter only a conscientious pack. The only difference of opinion was as to methods. Here, of course, there is opportunity for much diversity of opinion.

This meeting was an adjournment of the former one held at Newcastle, account of which appeared in the Cultivator of October 7th, and was presided over by the same officers, Mr. Jeffrey, Chairman, and J. B. Adams of Newcastle, Secretary. The principal step taken was the appointment of a committee of fifteen composed of eight fruit growers and seven shippers, who were instructed to report at a later meeting to be held probably at Newcastle, with plan of organization and suggestions for standardizing the pack of Placer county peaches. The meeting was principally in the interests of Placer, but representative growers of the Sacramento Valley, including Gen. N. P. Chipman, Frank McKevitt, Senator Bills, J. P. Dargitz, Geo. H. Cutter, and Geo. E. King, were present. It is probable that this effort will lead to an organization far more extensive than a mere county movement. The next meeting of the kind is planned for Lodi, and the movement will probably spread till the whole Sacramento Valey is incorporated in it.

FANCHER CREEK NURSERIES INC

Geo. C. Roeding Pres. & Mgr

Box 12 Fresno, California, USA

Grand Valley, Colo., snips a hundred cars of fruit every week.

The committee appointed is made up of the following gentlemen:

G. Geraldson, Newcastle; L. A. Smith, Newcastle; H. M. Branstetter, Loomis; J. T. Law, Loomis; J. Thompson, Penryn; Robert Kays, Senator Birdsall, Auburn, and John B. Adams, Newcastle, all of whom are growers, and George D. Kellogg, Newcastle; A. Schnabel, Newcastle; George W. Bishel, Newcastle; E. L. Rippey, Loomis; J. Gibson, Penryn; Harry Poulter, Penryn, and J. D. Nagle, Newcastle, shippers.

At one time it looked as if the growers would insist that the entire committee be formed of growers, one or two being so prejudiced against the packers that they wished to have nothing to do with them and insisting that this was a growers' meeting only. Mr. McKevitt, representing the packers, suggested that this would be a proper plan, but the majority of the growers in attendance seemed to feel that this was a matter into which prejudice should not be allowed to enter, and that the brightest minds in both packing and growing interests should unite in studying out a plan which they should mutually undertake. One grower suggested that the committee was altogether too large, especially as to the eight growers, because he felt that anyone who could bring eight growers together on any one thing would be indeed a demigod. He insisted that the grower never appeared to be anxious to better his conditions if uniting with his fellow growers was necessary to accomplish it.

The method which has been followed in the past with poor results, is ranch packing. Mr. Dargitz of Acampo said that there could be no uniformity of pack where the grower, assisted by his family, packed independently. Reasons given for opposing the centralized packing house were the expense of hauling, liability of injury to unpacked fruit, and the fact that the women and children could not help in the work. In answer to these objections, Mr. Dargitz stated that he had packed fruit hauled sixteen miles on springs, that was delivered in excellent condition, and that the packing house gave opportunity to any grower's family to secure employment under competent instruction, enabling them to do better work than was possible when fruit was packed at the ranch home.

The appointment of a horticultural commissioner was also discussed at length. The county has heretofore had no working commission, due to the economical spirit of the supervisors, or rather to their failure to give the fruit growing interest any proportion of the money paid by it into the treasury. This point was made very emphatic by O. A. Bremner who presented a series of figures showing that the amount of taxes levied upon growing trees and vines and other horticultural improvements in the county, was 17.8 per cent of the whole amount, or a total of $7740, while for all the years that this has been maintained, the fruit growers have never received one penny in protection of their industry. It is assumed, however, that the board of supervisors are now awake to the necessity of giving some consideration to the industry and will meet the requests of the growers. Along this line, the following resolution was adopted:

"Resolved, That inasmuch as the last legislature enacted a law permitting boards of school trustees to make requests in advance of each year's tax levy of the board of supervisors for stipulated reasonable sums for the use of such school districts, such sums to be included in the tax levy, which we deem a good law and one conducive to efficiency and a law which would well apply to the needs of the various county horticultural commissioners, this convention would urge upon the next legislature the desirability of enacting similar legislation for the support of the office of county horticultural commissioner."

The resolutions passed by the former meeting at Newcastle, given below, were used as the basis of effort with the county board of supervisors:

"Resolved, That we view with alarm the encroachments of the peach worm

(Continued on Page 448.)

# Live Stock and Dairy

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

## COW GOSSIP.

**By Mrs. M. E. Sherman.**

THE way that dairymen may make cows profitable seems to have been mapped out carefully, so that now one has only to follow directions to come out ahead. There is a little book by Peck that gives a complete account of Rev. Mr. Dietrich's work in building up a herd and land at the same time. This book may be considered as inspiring to better work every one connected with the land. We need this in California greatly. We are skimming the land of its fertility. There was only a little good land after all in even fertile California and the wheat growers took the heart out of the best of it years ago. The soil needs some fertility added to it. Humus mostly is deficient. Now the cow on the land gives us a way to do this without having to pay out the price of the land for commercial fertilizers. Cover crops and cows are the need of the farmers to increase the fruit crop.

**Babcock Test.**

In the older times the only way the farmer had to find out the profitable cows was by churning the milk separated. I can remember at the first County Fair I ever attended as a very little girl, being fascinated by a comely woman having a series of box churns on one crank to make the butter from cream of each cow in a herd. This was the way the dairyman had to do if he wished to have any knowledge of his work. It was this testing by churn that permitted so many false records in the past, for some genius found out that if he turned warmed water into the churn that the butter would be greatly increased. This butter was padded with water often thirty-five per cent of its weight. The butter was weighed from the churn directly and the records were great. Prof. Babcock invented the testing machine and the mighty records were wiped out at once. Slowly the breeders weeded out their cows until at length the tide turned and a few cows made 20, then 25 pounds of butter in seven days, and then 30 pounds was reached, and now the number of cows is increasing that can make 20 pounds every day.

**First Machine.**

The first Babcock testing machine I ever saw came to the ranch from Chicago. We set it up and tried to run it. We burned the tests black or had them white ash. The trouble was explained to the wholesale drug house in San Francisco and they sent us a specific gravity test, and we had to allow more acid when it was weak or decrease it when too strong. We worked over that tin machine hard. It was a big circular box set up over a high drive wheel that turned by hand. The big wheel would take spells of missing the cogs of the small wheel that rotated the bottles inside the box, and then sometimes the bottles would collide inside and the entire contents spill out. This happened often enough to make it necessary to take a double test of each cow's milk and then arrange them in order so that the two bottles would not come in the machine at the same time.

**Knowledge.**

About this time there came an apple cheeked young man to the ranch. He had been a dairyman's son and had taken a course at the Pennsylvania School. I fancy he was about the only person that had ever run one of these machines. He proved an invaluable assistant for the next few years. He has always been modest about telling of the help he gave me at that time. I am speaking of Henry Saylor who afterwards became State Dairy Chemist. He has returned to his old love, the cows, and started a dairy herd of his own on his own ranch this winter. It is too hard for any one that has owned cows to give up the gentle creatures.

**Community Breeding.**

Farmers do not combine well, more's the pity, for the common herds would be readily improved if the neighbors bought a sire together. Twenty-five dollars apiece from six or eight men would bring a choice young animal from the East to head a herd of at least a hundred animals. When one community had owned the sire as long as possible, he could be exchanged with another set of farmers. It is one of the pitiable wastes to kill off tested sires. When one has shown that he is a good producer he should be retained as long as possible and then passed on to further usefulness, instead of going to the shambles. The calves of the developed sire are stronger than those from immature animals.

**Buttermilk.**

The health fad now runs to consumption of quantities of buttermilk. The wine men are viewing with interest the invasion of butter milk in the high class hotels. The bars also are selling it extensively. At the Waldorf-Astoria it requires one man to carry the buttermilk from the refrigerator to the bar. Another equally famous bar is selling fifty quarts a day. The new Latone buttermilk is very popular. Candy stores and drug stores sell it as well as the bars. The use of milk has increased rapidly of late in Eastern cities, now that the tuberculin scare has become an old cry. The creameries and cheese making plants near by have been closed, as the milk was being used fresh. This same thing has happened in California. In the San Joaquin valley much of the cream goes directly to Los Angeles for use as fresh cream. This in turn brings butter from farther away. The Imperial district has a great dairy future before it in furnishing the whole of Southern California. The lands near the cities of the south are needed for small fruits and vegetables, while the orange and fruit land is too valuable for ordinary dairymen to own.—M. E. Sherman.

## EDUCATIONAL BUTTER SCORING CONTEST.

The results from scoring the fifth entry to the California Educational Butter Scoring Contest are given below. All entries arrived on time and in good condition. It is especially gratifying to note the care taken in packing most entries to insure arrival in best condition. One entry was carefully packed in ice and paper, and the score received speaks well for the ability of the buttermaker who sent it. With two exceptions, all the butter was made from gathered cream. The United Creameries receive about two-thirds whole milk, while the Pioneer receives all whole milk.

The scores are as follows:

| Name of Creamery | Address | Score. |
|---|---|---|
| Golden Creamery, | Etna Mills | 96 |
| San Pasqual Cream., | Escondido | 94 |
| Salinas Creamery, | Salinas | 93 |
| United Creameries, | Arcata | 92 |
| Hicks Valley Cream., | Hicks Val. | 92 |
| Crystal C. & B. Co., | Sacramento | 91½ |
| Gridley Creamery, | Gridley | 91½ |
| Rose City Cream., | Chico | 91 |
| Ceres Creamery, | Ceres | 90½ |
| Pioneer Creamery, | Ferndale | 90½ |
| Suisun Creamery, | Suisun | 90 |
| Woodland Creamery, | Woodland | 90 |

As a whole, the butter submitted averaged low in flavor, but other defects were not especially noticeable save two or three entries that showed a weak body and one or two that gave a milky brine, indicating incomplete removal of buttermilk in washing. Most creameries at this season are bothered with small uantities of inferior cream so that low quality

# REPLACED

A great many disk-filled and other common, complicated cream separators are replaced every year by simple, sanitary Sharples Dairy Tubulars.

Women prefer Tubulars because Tubulars are easiest to clean. Men prefer Tubulars because Tubulars wear a lifetime, run easiest, skim cleanest, skim fastest.

Tubulars probably replace more common separators every year than any other maker sells. Tubulars are the only modern separator—The World's Best. World's largest separator factory. Oldest separator manufacturing concern in America. Branch factories in Canada and Germany. Sales easily exceed most, if not all, others combined.

Geo. C. Roeding, Fresno, Cal., breeder of Thoroughbred Holstein Bulls and Heifers Thoroughbred Berkshire Boars and Sows

might reasonably be expected. Seventy per cent of the entries were made by using starter. The amount used varied from 10 per cent. to 40 per cent In only two instances was the cream pasteurized.

The entry from Golden Creamery, which received a score of 96, was an excellent piece of butter in every regard. It was made from gathered cream one day old and containing 36 per cent butter fat. Twenty per cent of starter was added. It was then held for four hours at 60 degrees F. cooled to 50 degrees F. and churned. The buttermilk was 54 degrees F. and the wash water 56 degrees F. Salt was added at the rate of three-quarters ounce to 100 pounds of butter.

The last entry for the current year will be called for the last of November, and the scoring will take place at the University Farm in the presence of the Short Course Creamery students. It is urged that as many butter makers as possible accompany their entry to the contest. Special attractions will be offered. The November entries will decide the winner of the prize cups to be awarded on the basis of the high est and second highest average of the six contests. As it now stands, there is only .7 of a point difference in the average scores of two of the regular contestants, each of which has received the highest score twice. In view of this fact, there is some speculation as to who will gain first place for the year. Notice of the exact date will be made later.—Herbert A. Hopper.

### THE MULE-FOOT HOG IN IDAHO.

The mule-foot hog is unquestionably the animal for the southern country. This is the first time that this breed has ever been brought to the intermountain region, and I am satisfied that it will prove to be one of profit for the farmers. The origin of the mule foot is rather obscure and its history hazy. We have learned, however, that it came from the Eastern coast of Africa and the South Sea Islands. In character it is, in the vernacular of the hog man, about midway between a bacon and a lard hog. Its hoofs are solid like those of the mule and it thereby gets its name.

While this hog fattens and thrives fully as well on alfalfa, peas and small grains as do the other kinds, if not better, it has a distinct advantage over the others, in that it is not susceptible and, in fact, is immune to all hog diseases, particularly cholera. This disease is the one which bothers all hog raisers and kills off thousands of hogs every year. A thoroughbred mule-foot hog, such as the kind I have, has never been known to have hog cholera. I have a number of this kind and I am certain that its fine points will appeal to the people in this country and they will become active in taking up this industry.—Spokane Review.

## Veterinary

### Rubs Tail.

What is remedy for young horse that backs up to barn or fence and rubs violently from side to side?—E. D., Hemet.

Rub the dock with kerosene once daily until it is tender to the touch. Repeat the first time you catch him rubbing again.—R. T. W.

### DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

# NATIONAL DAIRY SHOW
# De Laval
# BUTTER AWARD TRIUMPH AS USUAL

The great NATIONAL DAIRY SHOW was held at Milwaukee, Wis., October 15-24, and in keeping with the invariable result since "ALPHA-DISC" DE LAVAL CREAM SEPARATORS went into use all the HIGHEST BUTTER and CREAM awards went to DE LAVAL users, in this latest representative contest, which included the exhibits of nearly one thousand of the best butter and cream producers throughout the country.

The three highest awards in the CREAMERY BUTTER class—all to DE LAVAL users—were as follows:

| | |
|---|---|
| A. J. Anderson, Otisco, Minn., | Score 97 |
| Thor. Moe, Winthrop, Minn., | Score 96½ |
| A. L. Oestrich, Watertown, Wisc., | Score 96 |

The highest award on DAIRY BUTTER was to P. Daingaard, Camp Point, Ill.—Score 94½—a DE LAVAL user.

The highest award in the CREAMERY PATRONS contest was to G. Van B. Roberts, Highland, N. Y.—Score 99— a DE LAVAL user.

The highest award in thhe CREAMERY PATRONS contest for hand separator cream was to G. B. Fisher, Viroqua, Wis. —Score 93½—a DE LAVAL user.

Full details of all the entries and scores have not yet been made public, but there is no doubt that the vast majority of all exhibits scoring 90 and above will prove to have been DE LAVAL made, as heretofore.

Incomplete reports have been received of highest butter awards at the various STATE FAIRS this year, but practically all of them have been to DE LAVAL users, including particularly New York, Indiana, Michigan, Missouri, North Dakota and South Dakota.

As has been said before, the separator does not of itself insure the making of the best butter, but the superior mechanical and sanitary bowl construction and low speed of the DE LAVAL separator indisputably enable the production of better cream and better butter under the same conditions than can possibly be made in any other way.

This is something that even the most enterprising and resourceful of those who seek profit through the manufacture and sale of would-be competing separators ever attempt to explain or deny,—that practically all the best butter, as evidenced by the highest awards in all representative butter contests, is and has for more than twenty years been made by users of DE LAVAL cream separators.

Hence the great advantage to every DE LAVAL user in having the separator that not only makes the MOST but the BEST cream and butter, is the simplest and easiest machine to use and lasts an average of twenty years against from two to five years in the case of all others.

A DE LAVAL catalogue helps to make plain the reasons for DE LAVAL superiority in good buttermaking and other respects, and is to be had for the asking.

# Practical Tools

To produce a level surface requires a keen plane; to make an exact mortise calls for a true-edged chisel; to bore a smooth hole you must have a clean-lipped bit in a steady brace; to saw a straight edge demands a perfect saw; and so on through the realm of practical work.

Tools that get out of order quickly are useless to the worker. Right here the value of

## KEEN KUTTER

Tools and Cutlery becomes supreme. Scientifically forged, shaped, tempered and finished, they not only do their work with absolute accuracy, but maintain their fine working qualities through thick and thin.

Thus the name Keen Kutter stands everywhere for the most practical tools for practical work. This is worth remembering when next you buy tools.

Keen Kutter Tools include Carpenter Tools of all kinds, Farm and Garden Tools. Also a full line of Scissors and Shears, Pocket-knives and Table Cutlery.

If not at your dealer's, write us.

# Small Fruits and Vegetables

## MODERN INTENSIVE MARKET-GARDEN.

THE first thing to consider is the location. This should not be over five miles, as only one trip a day can be made to market; whereas, if less, two trips can easily be made. Thus it would be cheaper to pay $500 per acre for a place within the above limit than to pay $100 per acre for a location farther out. The saving in teaming and time of a man would more than pay the difference in interest and taxes.

Another important consideration in the selection of a location is the soil. This should be of a sandy nature, with a sub-soil of yellow loam over sand. This character of soil is especially adapted to quick-growing crops. If there is a clay subsoil, the land is likely to be cold and will not drain quickly enough to grow early crops in either a wet or a dry season. If possible the land should have a southern slope, thus assuring earliness of crops and better adaptability to irrigation.

The location being chosen, the next thing is the necessary equipment to do a paying business. This article will consider a place of ten acres to cost $5,000 for the land and $5,000 more for the buildings, including house, stable and wash-shed. Then an additional $5,000 is required for three greenhouses, each to be 200 feet long and 30 feet wide. It would be impracticable to have less than three greenhouses because of the different temperatures required by the different crops. These crops may be limited to five, namely cucumbers, radishes, lettuce, parsely and tomatoes. Taking into consideration the varied conditions that these crops require, it can readily be seen how little could be done with less glass area.

In addition to the houses, more or less hotbed sash will be required in the spring. The grower will need at least 400 sashes, at a cost of $2.50 each. Then the fences, mats, planks and shutters will cost about $2.50 for every sash, making a total of $2,000. Under these sashes are grown many crops, and they are especially valuable for the hardening-off of plants which have been started in the houses, transplanted to these beds, and later to be planted in the field. It would be impossible to do this work in the houses; thus it is seen what an important part the sashes take in the growing of many crops.—From Cyclopedia of American Agriculture. Reproduced by permission of The Macmillan Company, New York.

The dewberry may be propagated by layering the tips or from root cuttings. In fact the plants are so easily secured that one may generally get them from his neighbors' plantation more easily than from a nurseryman. If plants are required by the wholesale a good plan is to plow a furrow along the row, place the tips of the runners in this and turn a light furrow back upon them; the tips must be actually covered. This work should be done before the opening of the picking season in most altitudes, and the plants will be ready for next spring's setting. Deep cultivation that will disturb or break large roots will cause many new plants to start. If an old bed is to be discarded, a good crop of plants may be secured by thoroughly plowing and working down the bed in the spring allowing the young plants to spring up from the broken roots the following summer. Root-cuttings, from roots the size of a lead pencil, may be taken in the fall, stored in moist sand over winter and planted out in nursery rows the following spring. If these root-cuttings are well cared for during the winter and planted three inches deep in a good soil, kept well moistened, a fair per cent will produce plants. Root-cuttings taken in the spring and planted in the same way will also give fair results. The dewberry does not sucker as freely as the blackberry, neither does it root as readily from root-cuttings.

Fruit and vegetables require plenty of moisture for maturing with size and high flavor. When the weather is dry keep the cultivator going between the rows, repeating every three or four days. Use a cultivator with many small shovels and run the shovels only two or three inches deep. Cultivate the plants when they are young to make them grow rapidly and when they are older to furnish moisture for good maturity.

All small fruits require much moisture when the fruit is ripening. If surface cultivation for conserving soil moisture or irrigation cannot be practiced, mulching with straw or other litter will hold the moisture in the soil and help the fruit to ripen and grow to large size. Blackberries, ripening late in the season, often suffer and the fruit dries up on the vines for lack of moisture. Keeping the weeds down in the blackberry patch and mulching between rows and among plants with an old straw stack or spoiled hay will help wonderfully.

# Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon application.

### POTTING HOUSE PLANTS.

ONE of the first essentials in house plant culture is correct potting of plants. As preparation and fertilization of the garden soil are of prime importance to a successful garden, so is potting to the success of indoor plants.

The soil for potted plants must be the very best and richest, for the root of the potted plant must draw its foods from a very limited quantity. The soil must not only be fertile, but it must be of good physical nature, relatively light in most cases, friable, and retentive of moisture, but it must be capable of parting with it readily so that the necessary air may enter for feeding the roots. For the same reason, the drainage must be ample, and to this end, gravel or broken crockery are placed in the bottom of the pot, and some coarse sand is mixed with the soil.

Good potting soil must contain humus, or decayed vegetable matter. The best for this purpose can be made by piling up sods and allowing them to decay. Where this is not practicable, secure soil for potting along an old fence row where the sod has more or less decayed and left loose, rich, friable soil. This is an easy matter, as at various points along almost any fence row bare spaces can be found where the grass has died and the sod rotted. To this loose soil may be added, some fertile garden soil, and a small proportion of sand, unless the oil already contains sand.

Fill the pot to about half full of drainage material and soil, then set the roots of the plant to be potted upon this, filling the very finest of soil about the roots and pressing the soil down with the thumbs when the pot is full. Give the pot a thorough soaking with water and set away in a moderately dark and cool place for four or five days to give a chance for the new roots to begin to grow. Bring the new potted plant into direct sunlight gradually, and water only after the soil has become thoroughly dry. Never water in small amounts and often, but give a good soaking with water and let it go till it really needs it again. Never keep the soil continually soaked with water, as that shuts out air from the roots of the plant.—Journal of Agriculture.

### NATURAL PARKS.

Our lesser municipalities, still more than our large cities, must look for lands of low cost when contemplating the acquisition of park lands. By a strange provision of nature those lands which by reason of rugged topography or marshy soils are unfitted for agricultural purposes are the very best for desirable landscape effects and may, by a judicious selection of plants be converted into quiet woodland scenes.

How often do we find, on the outskirts of a town or city a marshy piece of ground containing some water during part or all of the year, for which no use can be found aside from that of a refuse dump. Almost invariably there are some trees and shrubs on such tracts which could form a pleasing nucleus for a park plantation. These tule-bordered pools may be made a little more secure against the escape of water, the marshy shores dug out a little to make dryer paths along the pond margin, and the park is under way and usable. On hills with precipitous sides young peppers and drought-resistant eucalypts and other trees may be planted, watered for at least one season, and shade trees will soon result. The leaders or terminal growth of the young eucalypts should be cut off at the end of the first season's growth. This will leave less top for the roots to support and cause the young tree to branch, thereby producing an umbrageous shape so necessary for shade.—L. A. Times.

Tobacco dust is death to the wooly aphis. Tobacco good enough for the pest can be raised on almost any farm.

# California's Most Profitable Product

Crimson Winter Rhubarb is one of California's most profitable products. We make this statement after giving it an actual test. We have made a study of the production and marketing of

## Crimson Winter Rhubarb

for a number of years, and can say beyond a doubt it is the most profitable crop produced in California. So much progress has been made in the line of growing and marketing the product that the growers have organized and act along similar lines as the Fruit Exchange does for the orange growers.

## Time to Clean Up.

IT IS SAID that first impressions are lasting; we believe that last impressions are nearly as permanent. In either case, we do not think the town of Davis appreciates its opportunity of making a good impression on visitors to the state farm. The first impression we received a year ago when walking down the main approach to the farm was that a most unfortunate selection of location had been made. This impression was in no way changed this year. We found the same dilapidated, moss grown fences held up by a few additional props; the same weeds, except where broken down by the pigs roaming along the streets; the same pigsties with the same offensive odors; and the same cow yards with the same manure heaps a little nearer the eaves of the sheds against which they were piled; the same breeding ground for untold millions of files.

The boys who go there now may have rooms in the dormitory which is clean and attractive. For board many of them, 14 to 16 years of age, go to the hotel, the most prominent room of which is the bar, and along the main street are a number of other saloons. The Cultivator is not discussing the saloon question, for that is not a cultural topic. However, it is universally demanded that our youth be educated in a clean moral atmosphere. The men who have sent their sons to the two great institutions at Berkeley and Stanford have insisted that they have clean surroundings, and the saloon has been banished. Even the state penal institution at San Quentin and the state school at Whittier permit no saloons within a mile and a half of their grounds. We believe the farmers of the state have an equal right to demand good surroundings for their sons. Davis has taken up this matter, and a majority of the voters have decided to retain the saloons. If these conditions still obtain, and there is no other way of securing freedom from such influences, many parents will consider long before taking the responsibility of sending their sons away from home into such an environment.

The lessons which the boy learns are not wholly from books handed him by his instructor. His environment has much to do with his upbuilding and his desire to live up to the best there is in him. Had this farm been located in many towns of California, the first lumber would hardly have been hauled for the buildings before some enterprising real estate man would have had control of the entire row of lots fronting on the approach to the farm, and instead of pigsties and corrals, it would have shown tasteful bungalows set in lawns, and the other factors which we have mentioned as detrimental to the highest development of the boy's life would have been eliminated. The Cultivator has no desire to say what will injure any community in the state. We do not believe anything we can say could injure Davis as much as its general appearance. When these conditions are corrected, we believe the young men of the state can go there and be greatly benefited by California's Agricultural College.

## A Fine Product.

MR. KING remarked at the Loomis meeting last week that from 52 peach trees he had marketed five and one-half tons of peaches, and these were of such quality that he had only 300 pounds of culls in the lot, the large percentage of them running 84-to-the-box size. It costs no more to produce such high-grade fruit, and the returns are so vastly superior we cannot see why more growers do not follow the examples of such producers. As one speaker at the same meeting said, it is better to produce two boxes of high grade 84-to-the-box size of peaches than it is to produce four boxes of only medium fruit. It costs twenty-five cents to the box to grow and pack the fruit. If it sells for one dollar, there is a fine profit left for the grower, but if, instead of producing and selling two boxes for two dollars, the grower produces four boxes for two dollars, his profit is more than cut in two. If again, his production reaches eight boxes, with the same expenditure of energy on the part of the tree, the fruit will be of such inferior size that it will not bring more than two bits per box, and the fruit grower simply gets the money back that he spent in producing the inferior fruit.

The satisfaction one takes in producing a fine article should be sufficient to induce him to bring up the grade of his fruit, but satisfaction does not go far in bringing to the farm things which are desired, so much as increased profits, and so long as increased profits can be made with the more satisfactory appearance, it seems to us that every famer should seek to be in the two-box class of peach producers.

## Pedigreed Scrubs.

Speaking of judging and of the breeding of dairy animals, at Davis last week, Mr. Hawk said that it was necessary, if one wished a producing strain of dairy cattle, to throw out "pedigreed scrubs." The time is past when the simple statement that a cow has a pedigree or is capable of registry, is sufficient to give glory and sale at a long price. It is now recognized that there are scrubs subject to registry, as well as in the barn yards which have never seen a registered animal. That like begets like, is one of the principles of breeding, but there are times when the defects of generations back crop out, and the son or daughter of a big producer may prove of almost no value. Every producer should watch for this class of animals and eradicate them from his herd.

## Politics vs. Fruit Growing.

LOS ANGELES COUNTY fruit growers are indignant. An effort has been made to secure an efficient horticultural commissioner who would appoint deputies qualified to serve the growers because of their knowledge of the fruit business and general fitness for the office. The property interests represented by the committee which appealed for the appointment of Mr. Beemis instead of Mr. Dingle, exceeded twenty millions of dollars. The growers stood in solid mass in a request that Mr. Ervin Dingle should not be made a deputy, for he did his best to prevent the passage of a horticultural law demanded by the growers of the last legislature. But through political influences, it is claimed, Mr. Meserve, who was appointed commissioner, has named Dingle as a deputy. This action has placed Mr. Meserve in a very embarassing position before those whom he is to serve.

## Tumble Down Buildings.

JUDGE SHIELDS remarked in his address to the students at Davis last week, "As long as the barn is characterized by tumbledown buildings, it and its products will be discredited." Prof. Major in addressing the same body on another day, remarked that the best advertisement which any livestock producer could have, next to producing highbred animals, was the condition of the barns and surroundings. Illy kept yards, fences, and buildings are generally taken as an indication of carelessness, and carclessness in breeding is the last thing which can be tolerated by the man who desires thoroughbred stock. There is a whole sermon in these remarks of Judge Shields and Prof. Major.

## Instructive Week at the State Farm

(Continued from Page 435.)

word and example giving the positive side. "Agriculture is one of the most promising industries in which a young man can engage, because the young men have gone off into other lines of work." The speaker referred to one lesson of his boyhood; he found that he often caught the most and the biggest fish in the hole the other boys shunned. Another instance in illustration of the same fact was this: The new Hotel Sacramento recently inserted two small advertisements in the same paper, one calling for a stenographer, the other for poultry supplies. There were over 1000 responses to the stenographer advertisement, and none to the poultry. Certainly the poultry business is not over crowded.

"Get together and form an alliance with your neighbors; it is essential to your success. Don't hang back when a forward movement is started. Your zeal for your neighborhood organization should be similar to your zeal for your party."

Judge Shields appealed especially to the boys to distinguish themselves. Each one, he said, should be above the average. "Listen to conversations, lift yourself; improve your carriage a little bit; improve your diction. These things will lift you in the eyes of others; they will distinguish you. The common language of the day is so tinged with slang, that he who speaks correctly attracts instant attention when he speaks in any company of people."

"Learn to use your library. Learn what the U. S. Department of Agriculture has that will benefit you; learn what your own State University publishes. In every way seek for your own upbuilding. Learn that farming is an intellectual calling. As you learn these things, you may feel lost in the immensity of the subject and in its complexity. Bacon says, 'Reading makes the full man; writing the exact man; speaking the ready man.' I would have you write. Nothing improves you more than writing down your own thoughts. Then you learn what you do not know." As a homely illustration of the benefit of writing, Judge Shields suggested that if a boy should start out to write an essay on the building of a pig pen, it would lead to almost untold knowledge regarding pigs and their habits, amount of space required for an animal, and as he continued his writing, he would find himself looking for all kinds of facts regarding pig husbandry. Such a subject, so treated, will amply qualify any student to receive his college degree.

"Avoid the poison of luxury. Let every one do his part. Be above the average. Work for the supremacy of Agriculture. Learn the delights of your calling."

# Agricultural News Notes of the Pacific Coast

## Northern California

Supervisors of Yuba county are discussing ways and means of road improvement.

Rice production in Butte county has reached the stage where it is almost assured that a regular industry will result.

Steps are being taken at Paradise, Butte county, to form a local organization to affiliate with the California Fruit Exchange.

Paradise, Butte county, recently observed a Fruit and Flower Festival which drew many outsiders to the little mountain town.

It is reported that the orange crop of Oroville orchards will this year exceed any former crop. The estimate is 400 cars from Butte county.

The state engineer has reported that it will be necessary to widen and straighten the channel of portions of the Feather River, especially near Biggs and Oroville.

Sutter county growers are realizing good returns from the first carloads of seedless raisins shipped east, prices ranging from five and one-half to seven cents per pound.

The bean harvest is in full blast in Yolo county. The yield will be from fifteen to twenty sacks per acre. The sacks average 90 pounds and $3.35 is offered with conditions pointing to better price.

J. C. Wilson of the land department of the Hamilton Sugar Beet Factory, is interesting the farmers of Yuba county in the beet industry, it having been proven that the soil is well adapted for that vegetable.

The Shasta county farmers association and the Mountain Copper Co. have settled the details of minimizing the smoke nuisance, and the company is preparing to resume operations at its Keswick plant.

Many tons of tomatoes have spoiled in Ukiah on account of the cannery not being operated this year. The growers were offered seven dollars a ton for their product, but concluded that this would not pay for picking and freight.

The Sacramento Bee says that the largest shipment of hay ever made from the northern part of the state was consigned by farmer Bailey of Madeline, Lassen county, to the Philippine Islands. It filled 150 freight cars. This speaks well for Lassen county.

The Placer County Farmers Union has elected the following officers: Lewis A. Smith, of Long Valley, President; John Clarke, of Rock Creek, 1st vice-president; H. M. Branstetter, Loomis, 2nd vice-president; A. M. Vivla, of Edgewood, recording secretary; H. G. Gage, corresponding secretary and treasurer.

A grain grower at Arcata, Humboldt county, has returned from a trip over Oregon and Washington where he purchased some 40 tons of seed oats of Imperial Gray variety. It is thought these oats will produce in Humboldt county from 75 to 90 bushels per acre. This variety was introduced into Alberta, Can., from Australia two years ago.

## Central California

Fresno county held her third annual fair at Fresno last week.

The first car of oranges from Porterville was shipped October 20th.

A number of German colonists recently located in Kern county.

Kerman reports 65 bushels of sweet potatoes on an eighth of an acre.

The Tulare county citrus fair will be held this year at Dinuba about the first of December.

The California Dried Fruit Agency has procured the lease of the Chaddock packinghouse at Fowler.

The Loma Prieta Lumber Co. is planting 25,000 eucalyptus trees around its old mill site back of Aptos.

Tulare county now has a bounty of three cents each for squirrel tails, in effect until the last day of January, 1910.

Tulare county will offer from December 1st to the last day of February a bounty of two dollars for coyote skins.

Sanger orange growers contemplate the placing of artistic placards regarding Sanger oranges in each box shipped from that section.

The orange crop of the Porterville section is running to large sizes, nearly all of the pack thus far being in the neighborhood of 126.

Offerings of California Bellefleurs in New Orleans have been heavier the present year that any other season on account of the quality.

Watsonville claims to have a new variety of apple somewhat similar in appearance to the Winesap, but greatly superior in quality. It gives promise of a great future.

The people of Oakdale, Stanislaus county, have voted for the formation of an irrigation district under the Wright law. The new district will comprise about 60,000 acres.

The state convention of the California division Farmers Educational and Co-operative Union will be held at Fresno, Nov. 8th. The permanent office of the union is 1151 J. St., Fresno.

Five hundred carloads of sugar beets have been shipped from Kings City and Elsa during the months of September and October. Last year the total crop amounted only to 100 carloads.

Reports from the Spreckels sugar factory are to the effect that beets are coming in so rapidly that it is almost impossible to handle them. The season's run bids fair to be one of the most prosperous for years.

The Fresno county exhibit at the Seattle fair has been secured by the Union Pacific Railroad and they will use it in a campaign of advertising through the Eastern states, which will be a mighty good advertising card for Fresno county and California.

In spite of the low price of wine grapes this year, large shipments have been made from Turlock since the season opened. The average price paid is $7.50 per ton, and it is estimated that a total of over 200 tons has been shipped during the season.

## Southern California

A carload of hogs was shipped from the Imperial Valley to El Paso last week.

Cabbage growers of the Fullerton district are planning to plant a big crop this season.

The new crop of walnuts is of exceptionally fine quality though somewhat lighter than anticipated.

Our Imperial county exchanges are enthusiastically booming the cotton producing possibilities of their locality.

It is said that the acreage of barley planted in the Imperial Valley this year is equal to that of any two previous years.

The city trustees of the city of Colton are planning to set out a water bearing tract of twelve acres to eucalyptus trees.

The Anaheim Chamber of Commerce have passed resolutions to aid any packing house opened and maintained in that city.

A few weeks ago local buyers of Fullerton were paying $20 per ton for tomatoes, later $25 and now the offer is $30 per ton.

Owing to the olive crop being a little short, the price in San Bernardino county is good and olive orchards are proving very profitable.

The Associated Chambers of Commerce of Orange county are opposed to any encouragement to Japanese immigration by the sending of Orange county literature to the Orient.

The horticultural commissioner of Imperial county has offered cash prizes for the first, second and third best collections of insects gathered in Imperial county before December 1st.

As the season nears its close, it is evident the 40,000 car shipment of oranges and lemons which had been predicted, will not be reached, but it will be near the 38,000 mark, and will run to 32,000 cars of oranges alone.

The past six weeks a hundred or more people have been gathering and packing about 200 carloads of apples in the Yucaipe Valley, San Bernardino county. The crop this year was larger than ever before, and the price better.

Walnuts and celery will net the growers good returns from the Fullerton district this season. Shipments of celery have commenced, and it is estimated that there will be from 1800 to 2000 cars from Orange county and south of Los Angeles.

The county meeting of the farmers union to elect county officers was held at Coachella last week. Officers elected to serve until January are: George I. Martin, president; Geo. B. Royce, vice-president, Wm. T. Crawford, secretary and treasurer.

An acre of ground planted to cotton on the Wilsie ranch west of El Centro, was carefully measured and then picked for the first time, the cotton being taken to the gin and weighed. The total yield, including seed, was estimated at $115 per acre. A liberal allowance of forty dollars an acre is allowed for expenses, leaving a net profit of $75.

## The Coast

The reclamation service has issued a booklet advertising the Yuma Project.

Oregon apple growers report the biggest returns ever received for apples.

The Grant's Pass country in southern Oregon claims it will be the greatest Tokay country.

The first state road in Washington was recently opened with a barbecue and picnic at Washougal.

The Sulphur Springs Valley, Arizona, ranchers report the biggest crop of hay in twelve years.

Secretary Ballinger recently investigated the Arizona lands below the great Laguna dam near Yuma.

The State Land Board of Oregon has decided to increase the price of indemnity selection land from $8.75 to $10.00.

Rogue River berry growers have suffered greatly from lack of water and are now contemplating extensive improvements in irrigation systems.

A potato story from Washington is to the effect that a man dug from one hill of Early Rose variety 62 potatoes, the fifteen largest weighing 25 pounds.

The Salt River Valley, Arizona, people are much encouraged since the visit of Secretary Ballinger. Possibilities of this great valley are wonderful.

The U. S. Civil Service Commission held examinations at various points in Arizona Monday and Tuesday for applicants for positions in national forest work.

The Interior Department announces the opening of the Yuma Indian Reservation. Registration may begin on January 5th and the place of registration will be Yuma.

The cattle ranges in Arizona it is said were never better, and the cattle are in excellent condition. Cattlemen expect better prices next spring than for some years past.

The Grand Junction, Colorado, schools will be dismissed and the children given a vacation of two weeks to help harvest the fruit crop claimed to be worth $1,500,000.

Apples grown in the Wenatchee Valley, Washington, on land where fruit experts doubted their successful growth, are now being marketed at the rate of ten carloads a day.

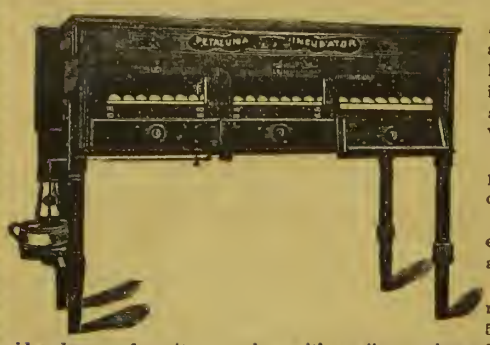
High price of feed is proving discouraging to sheep owners, and while sheep are coming out of the summer range fat and healthy, herders at Pendleton, Oregon, are selling rather than carry through the winter.

The Oregon Agricultural College and Experimental Station is sending a farm demonstration train over the O. R. & N. line, which will give practical lessons in farming pursuits by a competent staff of instructors.

The growth of the apple industry of Oregon is indicated by apple fairs, one at Albany and one at Hood River, during October; the National Show to be held at Spokane November 15th, and the State meeting at Portland, commencing December 7th.

# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

## Petaluma Incubator Company

**Petaluma, Cal.** **Indianapolis, Ind.**

Our General Agents for Incubators and Brooders and Midland Poultry Food:
**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

# STANDARD EGG FOOD

The kind that makes hens lay when other foods fail.

**90 Lb. Sack $2.35**

**Acme Roup Cure is Guaranteed. 50c Postpaid.**

**HENRY ALBERS CO., 845** S. Spring St. Los Angeles

## MRS. C. D. HUBBARD'S WHITE WYANDOTTES

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## FATTENING THE THANKSGIVING TURKEY.

By Mrs. Frank Metcalf.

AND now the November days are come, and one smacks one's lips in anticipation of the annual feast of good things, of which the lordly turkey is the center of attraction. At this time the turkeys should have large frames upon which to build the delicious flesh, should be healthy from as large range as we can give them, ready for the last fattening process, and perfectly free from lice.

The digestion of a turkey is the most delicate of any domestic animal or fowl, so we must not overdo the fattening, and too long a time must not be given to the finishing up process, lest we lose more than we gain. As the nights grow cooler, feed more and more grain, and now is the time to give corn. Old corn is said to be best for fattening turkeys, but if this is not to be had, feed new corn that is matured enough to shell. For the quickest results and the tenderest flesh, boil the corn all day (a fireless cooker will come into play here) and feed warm, but not hot, all they will eat at night, and the quantity will surprise you. This boiled corn is the most easily digested food you can give them at night, and they will be ready for a good breakfast early next morning. This breakfast may consist of boiled carrots, potatoes or other vegetables stiffened with bran and corn meal, a food of which they are extremely fond, and mixed grains, wheat, oats and barley( rolled) where they may get it during the day. Give them the range to which they are accustomed, as turkeys shut up will lose more from fretting than you can put on by extra feeding, so do not try to confine them in the hope of hastening the fattening. Stale bread soaked in milk may be given for the last few days, all they will eat, if a particularly fine flavor is desired, but never neglect the warm boiled corn at night.

Two weeks of this stuffing if very thin, ten days if in good condition, should make a plump, tender and delicious carcass fit for the table of the most deserving consumer who is, when all is said and done, the patient woman who raises them.—Mrs. Frank Metcalf.

## POULTRY QUERIES.

### Treatment for Colds.

Several of my turkeys, nearly five months old, have swelling under one or both eyes, close to the beak, and eyes water. They seem hearty and well otherwise. They were all perfectly healthy, with wide, dry range all summer until this swelling occurred, which was soon after a rain. During the rainy night the turkeys sat on a pole, unsheltered. Did this have anything to do with the trouble, or is it some contagious disease? What can I do for it?—Subscriber, Lindsay.

Your turkeys have taken cold and should have three drops of the oil of eucalyptus upon a small lump of sugar. Wash the heads and eyes well and dry thoroughly, then apply camphorated lard, or carbolic salve to the affected places. Repeat the oil of eucalyptus night and morning until entirely cured.—Mrs. Metcalf.

### Liver Trouble.

Can you tell me what to do for hens that lose the use of their legs, refuse to eat, and die within four or five days?—E. E. C., Alpaugh.

Without a complete description of surroundings and food supplied, it is difficult to answer, but I should say those hens had liver complaint, from too much starch in their ration or too much condimental food. This will happen to hens that are forced for egg-production, and the cure would be a liver pill, and a light diet for some time. Often a dose of castor oil would benefit, but it is difficult to administer, unless one drops it down the throat carefully and as a teaspoonful should be given, this is rather tedious. Over-fat hens are sometimes subject to liver trouble, and die of apoplexy very suddenly. A scratch shed, where all grain must be exercised for is best, but if not available, dig up the ground and bury the grain there, thus making them work for a living.—Mrs. F. M.

### Colds.

What is the trouble with a chicken when he rattles in his throat, discharges from his nose and breath is very foul? What remedy would you recommend?—M. S., Vacaville.

Your bird is suffering from a bad cold which may develop into roup. Indeed the foul breath is almost a symptom that roup has already started. Take him from the rest of the flock, and do not allow him to drink from the same vessels with the well birds. There are many roup cures advertised in our pages that will do the work well, if used according to directions, but three drops of oil of eucalyptus on a lump of sugar twice a day is excellent. Another tried and true remedy is dipping the head twice a day in a 2 per cent solution of permanganate of potash until the bird strangles, which will cause it to clear the bronchial passages. Also put a few drops of the following mixture over his back, between the wings (which is directly over his lungs); oil of eucalyptus, one part; sweet oil, two parts; shake well. Gently massage the nostrils, squeezing out the air passages as much as possible, then, with a syringe inject a few drops of the mixed oils.—Mrs. F. M.

## DECAY OF EGGS.

In a bulletin issued by the Connecticut Experiment Station is an exhaustive treatment of bacteria in eggs and causes of decay. As is shown by the following quotation, this may at times be caused by the condition of the fowl at time the egg is laid.

Dissections of hens were made by the author and the ovary and oviduct were examined. "Bacteria were present in the oviduct of the hen even in the upper portion, so that an egg may be infected in the earlier stage of its formation. particularly at the time when the white or albumin is secreted. A diseased condition of the ovary of the hen may cause infection of the eggs. Poultrymen, especially those who dress large numbers of fowls, frequently find hens that are so diseased. Unfertile eggs are infected as well as fertile.

"Eggs may be infected after they have been laid, as it is possible for the bacteria to pass through the pores of the shell. Moisture plays a part in such infections, for while the egg is covered with its normal mucilaginous coating and kept in a dry place it is difficult to infect. Infection is not a difficult matter, however, when the egg is moist. Many egg shells are defective, caused by not feeding hens a sufficient amount of shell-forming foods. Eggs are liable to be infected soon after they are laid." Nine species of bacteria were found in one nest, hence the author thinks that nesting material is a great source of infection, for if this has been allowed to remain unchanged for a long time it becomes foul and teems with bacteria.

"Whatever the means of infection, it has been found that a larger percentage of the July, August, and early September eggs are infected or contain a greater number of bacteria (at a time they may be called 'fresh') than the eggs of the other months of the year, particularly when compared with the eggs laid during the months of April, May, and June. This corroborates the opinion of egg packers,

**Coulson's POULTRY FOODS**

made in Petaluma.

Do you want your hens to start laying quickly after the molt.

A scientifically prepared food like

**Coulson's Egg Food**

will do it.

who invariably prefer April, May and June eggs to those produced during the other months of the year.

"The fact that an egg contains bacteria does not mean that it is worthless. The question is mainly whether or not they are present in large numbers, and if present in small numbers, whether or not they are likely to multiply.

"Bacteria which are commonly found in eggs do not multiply at low temperatures. An egg that is kept at 34 degrees F. is safe from decomposition. Repeated experiments have shown that the rapid growth of bacteria does not occur until the temperature is raised over 55 degrees. While there is some growth at temperatures lower than 55 degrees, it is very slow. At the temperature of 98.6 degrees the bacteria in the egg multiply rapidly. In order to demonstrate the rapid multiplication of bacteria resulting in decomposition, a dozen (January) eggs were taken, and in six of them small holes were made and into each egg bacteria from a rotten egg were introduced on a platinum loop. These holes were sealed with wax and the eggs thus infected, together with the six untreated eggs, were placed in an incubator running at a temperature of 110 degrees. In 48 hours the 6 eggs which had been infected were so badly decomposed as to be very offensive and the remaining six showed no changes in them."

### MORE EGGS.

To show how to make hens more prolific layers the yellow press has shown itself to be a prolific "liar" by springing the following:

The hen is an innocent creature of limited understanding and fixed habits. It has always been a puzzle why hens invariably cross the road in front of rapidly-moving vehicles, and some people have reflected that the hen may be displaying the same degree of sense in her habit of laying only one egg a day when she might just as well lay two, and the world would be glad to have the doubled supply.

It is contended that the hen carries an ample supply of embryo eggs and could easily do better if it were not for the force of habit. The problem is to break the old habit and to aid the hen in forming a less stingy one.

The Philadelphia Record is authority for the statement that the farmers of Ringtown, Pa., are planning to try a novel scientific experiment on their hens, with the object of fooling them into laying two or three eggs a day. The hope is to trick their imagination by means of an electrical illusion.

The hens are to be kept in absolute darkness for several hours and then a bright light is to be turned on. The theory is that the hens, thinking it is full day and that they have overslept, will bestir themselves and lay again.

It is possible, however, that some prevention-of-cruelty society will come forward as "first friends" of the hens and object to this piece of deception worked upon the useful and simple-minded fowl.

---

Feed and water ducks at the same time. You will notice that they take a sip of water after every two or three bites of food.

---

No fowl should be killed for the table that has not been stuffed with fattening feed for at least a week previous.

---

If you intend to build a new poultryhouse set it facing the south and leave the front open.

---

For best results, all changes in mating should be made in the fall.

---

Geese are usually hardy and subject to no particular disease.

---

Keep the stock gentle and tame, and they will turn in more profit.

---

Two or three-year-old geese are more profitable than yearlings.

---

Two moth balls put into each nest will keep them free from lice.

**Can We Ship Chicks?**

**Read** Sept. 4th, we shipped 505 Rhode Island Red Baby Chicks to B. F. Selby, Big Pine, Cal. These chicks traveled 72 hours, (think that over) and 500 of them arrived alive and strong.

We know how to crate baby chicks to make them travel safe anywhere within 48 hours' travel. We have off large hatches every THURSDAY at present. Prices 10c and up. Send today for chick and egg catalog, it's free. Now is the time to get chicks.

(Continued from Page 439.)

in the orchards of California. We would impress upon our state horticultural commissioner and the society which he represents, the necessity for the enaction of more stringent laws by the legislature, if necessary, controlling the strict, intelligent and thorough supervision of the fruit industry in the state, under well qualified county horticultural commissioners, and a more liberal appropriation be made for carrying on this imimportant work. We urge upon the honorable board of supervisors of Placer county that they supplement state appropriations and legislation by appropriating county funds and authority.

"Resolved, That in view of the fact that the great Northwest furnishes a desirable market for our California fruits, and that their local inspectors are exceedingly alert in examination of fruits brought into their markets, and in condemnation of those not up to their standards, it behooves us to awake to the importance of the situation. We therefore urge that some system of inspection over the picking, selecting and packing of any and all fruits that are to be shipped out of this state be exercised, and that said inspector shall have absolute authority in the matter."

Further resolutions were:

"Resolved, That the system in vogue in Placer county of packing fruit in the orchards invariaby leads to a lower standard of quality, a lower standard of efficiency and a higher relative cost of production, while standard, or wholesale packing houses can be made an instrument of higher quality, higher efficiency, and lower cost of production; therefore, be it

"Resolved, That the fruit growers and shippers of Placer county, in convention assembled, hereby place themselves on record in favor of the adoption—as soon as may be practicable—of a general system of wholesale packing houses throughout the county which shall establish standards, and make a uniform pack of all fruits."

Regarding the candidate for this important position, Senator Bills said:

"If the candidate who has made application for this position shall have passed this examination, it is then that the supervisors should adhere strictly to the law and make the appointment entirely in the interest of his qualifications and not from any political affiliations, for a commissioner or inspector who depends upon political influence to retain his position usually is of little value to the county.

"With a strong man in each county to work in conjunction with him the state commissioner can accomplish wonderfully effective results and assure a great uplift for the present fruit industry of this section. It is therefore a duty you owe to yourselves as fruit growers and to your neighbors in this convention to work for the elimination of politics in connection with horticultural affairs."

Incidental reference was made to the fact that alfalfa has been taxed in this state for years, while grain and most other growing crops have not. This, Gen. Chipman said, "is one of the most iniquitous things ever emanating from the state comptroller's office." Why the alfalfa growers of the state should be compelled to pay a tax on their growing crop and the fruit growers on their trees and vines, are questions which the future state legislature should be asked to explain.

Placer county growers are in earnest and are making a noise like success. The end is not reached and the chronic objectors are saying: "I'm from Missouri, they've got to show me." Such fellows without mental grasp to appreciate the necessity for a forward movement are in every community. Placer will be no exception. Let not the progressive growers be discouraged if such people are in evidence.

The organization committee was instructed to call another meeting as soon as plans can be outlined. It will probably be at Newcastle soon.

## Country Life Commission

The following resolutions were passed at the Farmer's Week Session last week:

Whereas we as members of the short course in general agriculture known as "Farmers Week," held on the University Farm of the College of Agriculture of the University of California Octber 25 to 30, 1909, have been deeply impressed by importance of rural problems and their solutions as presented to us during a two-session discussion of the Report of the Country Life Commission appointed by President Roosevelt and whereas we desire to extend and deepen the appreciation of the vital and urgent importance of an adequate and permanent settlement of these questions to the progress and prosperity of the American people, therefore

Resolved that we recommend all regularly organized agricultural and educational associations of California to take up the discussion of the said report of the Country Life Commission at their regular meetings and especially to provide for such discussion at all annual meetings, general assemblies or conventions of California farmers and of California teachers which may be held under their auspices, to the end that the facts, suggestions and spirit of said report shall be widely understood and enforced upon the public mind.

Resolved that we desire to widely call atttention to the earnestness of sympathy with this report and skill in exposition of its premises and cnclusions as manifested in his leadership of our discussion of the report by Mr. W. A. Beard of Sacramento, member of the Country Life Commission from California, and that we advise other associations to invitc Mr. Beard to assist them in similar discussion at any meetings which they may arrange for the purpose, in the hope that he may find it possible without interference with his other duties to continue his disinterested public services in this way.

Resolved that our Senators and Representatives in Congress be requested to secure from the Congress of the United States such appropriatin as they may deem wise for the adequate public printing of the said report for general circulation and for the fuller compilation of the facts and suggestions which the Commission secured in its wide and deep inquiry into the present condition and outlook of rural life in America.

---

The farmer who has brought himself to the point of introducing alfalfa upon his land should be extremely careful in the selection of seed. In the first place it is important that he should sow seed produced in about the same latitude as his farm and from a region of about the same rainfall, thus keeping in a line of acclimation, and with the habits and habitat, as it were, of what he is seeking to raise. Next, he should not sow seed raised under irrigation if he is in a non-irrigating region. A Michigan farmer, for example, should sow seed grown as near to his latitude as possible, say, from Wisconsin, Minnesota or the Dakotas, or not south of Nebraska or Kansas. It is questionable at present, whether it is wise or profitable to attempt raising alfalfa seed in the more humid districts of the eastern and southern parts of the United States. It may be economy to leave the raising of seed to those regions with the least summer rainfall, keeping always in mind the securing of seed grown under conditions nearly like those to which the seed is to be introduced.—From Coburn's "The Book of Alfalfa."

---

Forests are produced by growing the trees close together and allowing the strong trees to kill off the weak ones. There is no other way of getting straight boles fit for timber.

This is also the way to make fence posts. The writer a few years ago saw a forest of elms that had been grown for fence posts. They had been set out in rows six feet apart and four feet apart in the row.

**Wireless Telegraphy** Now is the time to engage in the study of this new science. 1,000 operators wanted to fill positions created by U.S. government action. Salary of trained operators ranges from $15 to $40 per week.

**The Wireless Institute of California** is the best equipped wireless school in the world for teaching this science. We are located so that our high power station is in daily conversations with all stations on the Pacific Coast. R. R. Commercial School of Telegraphy owned and operated in connection with us. We can qualify you for a position anywhere. Young men and women write for descriptive circulars.

Q.—WHAT IS A COW?

Ans.—A square critter with a peg at each corner to stand on. Built square so as to hold a lot of food.

THE COW TALKS: I have been called a milk machine. As a milk machine I can turn out milk and cream, but not on wiry, musty hay; green grass is best, but when you don't have that, give me sugar-beet-pulp, (Kow-Breakfast-Food) and get a good big milk check every month.

SUGAR-BEET-PULP only costs fifty cents per ton now. It will cost more later on, after it has gone into silo. You had better put some in silo yourself and if you write to the LOS ALAMITOS SUGAR COMPANY quick, that is before they stop grinding beets down there, you can have some shipped in carlots at a reduced price so that you can afford to put it in silo and have it for use after the factory closes down.

MRS. ACOW.

**Out Door 1910 Style**

**Fireless Brooder Now Ready**

The best fireless brooder ever made at any price. Double walls, extra good heavy hover and board, rain, weather, rat and fool proof. Mistakes can't be made. Our experience is gained by handling 630,000 chicks this past year. Thousands of them in these brooders. We make both indoor and outdoor fireless brooders. Send for circular today.

This 150 chick outdoor brooder as illustrated $7. We pay freight. Order right now.

Indications are that the Fifth Annual National Stock Show at Denver, commencing the week of January 8th, will be one of the best ever held in the West.

The Beaumont Eucalyptus Association is very much pleased over the fine showing made by the growth of the rostrata and tereticornis varieties of red gums planted late last spring.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Planting Small Onions.

Please tell me whether small onions, not sets, if planted early, will make large onions?—H. H. S., Tulare.

No. They will almost invariably run to seed. With most varieties it is not safe to use sets much above one-half inch in diameter.—Q. A. L.

### House Plants.

What can I do to make my "Martha Washington" bloom? Foliage is fine, but there are no blossoms. What kind of fertilizer should I use for other house plants to insure fine bloom?—A. Y., Chico.

The presumption is that your plants are in the open ground and not in pots or boxes. If so, it is possible to give too much water and especially if the soil is fertile they will make foliage instead of bloom. You know I suppose that this class of geranium does not bloom as constantly as the others. In fact you can hardly expect but the one blooming period and that is the early part of the summer. I think you will find that later on your plants will bloom.

As to your other house plants, it is not always fertilizer that is wanted in order to secure blooms. Too much plant food with free watering will produce fine growth of foliage at the expense of bloom. If, however, your other plants do not seem to bloom because they are not thrifty and of good color, frequent light applications of pulverized sheep or cow manure is very safe and effective.—Q. A. L.

### Onions.

How low a temperature will growing onions endure? Is there danger from frost in most of our California valleys? If planted now, will they make early dried onions, or rather onions for the early market?—

I am not sure I can state just what degree of freezing will destroy a growing onion, but they will endure almost any frost likely to be found in California valleys. Even mature onions stored away for winter will come through a freeze unharmed if they are undisturbed while frosted.

It depends upon the variety whether they will make onions for the early market—varieties like the New Queen, White Bermuda or White Portugal would do, but such as Australian Brown, Yellow, Globe, Danvers, or Red Wethersfield should be planted in February as they are wanted for the main winter supply.—Q. A. L.

### Worms Eating Lawn.

We are troubled with worms eating the clover lawn. They seem to work at nig... and leave holes about the size of a lead pencil. The ground afterwards becomes bare. They are not the regular cutworm, but more like the army worm, only thicker.—A. S. K., Los Angeles.

It is possible that the cut worm treatment may succeed with this pest. Try sweetened bran mash in which a small quantity of Paris green is mixed. This should be scattered around just at nightime so it will not dry out before morning, and will probably capture the worms. If they are in limited numbers, hand picking may succeed. For more general treatment, an application of a commercial potash fertilizer will make it disagreeable for the worms and at the same time benefit the lawn.

### Peas for Fodder.

What is the best pea to plant for fodder, and at what stage should it be cut for milk cows?—A. L., San Bernardino.

The common Canadian field pea of the Prussian blue are the most satisfactory varieties. Some people follow the plan of planting barley or rye with peas, and find excellent results for forage or fodder. The stems of the cereal give support to the peas, they grow more upright, are more easily handled, and the tonnage is fully as great. This is usually fed green, and proves a most excellent soiling crop. It may be cut, cured and fed similarly to the grain hays.

### Apricots on Apples.

Can apricots be grafted on apple, pear, or cherry stock? I have some of the latter trees in an apricot orchard, and would like to graft to apricots or dig up and set to apricots. Is there a general rule covering grafting of different varieties of deciduous trees?—Subscriber, Reedley.

It would be impossible for you to graft your apples or pears over to apricots. Stone fruits may be grafted on stone fruits and seed fruit on seed fruit.

### Shetland Ponies.

Where may I secure a Shetland pony, mare?—C. E. G., Wodland, Yolo county.

We cannot help our subscriber and ask any who know of breeders of

these attractive little animals to let us know.

### Blackberries for Arizona.

Is Crandall's Early Blackberry a better and earlier berry than Lawton, etc., for hot interior valleys? What is the best red raspberry for the interior valleys?—Arizona.

I think the Crandall's Early an earlier and better variety anywhere in Southern California than the Lawton. Whether it will prove equally as good as the Lawton as far from the coast as Arizona can only be shown by an actual trial. A heavy mulching of straw and stable manure will be of great benefit no matter which variety is used. The Cuthbert seems to do well over a wider area, better than any of the red varieties now known.—Q. A. L.

### Brome Grass.

In the Cultivator of October 7, B. J. O'Mealy asks about the good and bad qualities of Bromus Inermis. I have experimented in a small way both here and at Red Bluff with Bromus Inermis, and native brome grass. Bromus Inermis grows about three feet high, and will make one crop of hay without irrigation on any ordinary land. California Brome grass grows four to five feet high and much thicker than the Hungarian Brome grass, and will make more hay per acre than wheat will on same class of land. Close pasturing during mid-summer will kill either, but if not pastured they make a thick permanent sod and seem to last indefinitely. Either kind is easily killed by plowing under with a good plow in the fall. Seed sown on well prepared land after the first rain usually makes a good stand. The native brome grass, starts a new growth as soon as the weather turns cool in the fall, and makes considerable winter growth.—C. K. Meyer, Tuolumne.

### Borers on Willows.

Regarding borers in weeping willows, in an inquiry sent you by Mr. F. E. Cressey, of El Centro, I promised to write you further upon receipt of the specimens. Mr. Cressey has been kind enough to send me some specimens and they prove to be the common flatheaded apple tree borers. The only means of control that is relied upon for these insects is the cutting out by means of a knife or special tool, which is to be had in certain sections.

The adult of this insect is a beetle, which lays its eggs on the bark of the trunk and larger branches. The larvae or borers hatch from these, remain in the sap wood for some time, but later penetrate deeper into the heart wood. Usually they can be cut out without much difficulty. Afterward the tree should be treated with a good coat of white-wash to protect the wounds from sunburn, and this also acts more or less as a repellant in preventing the beetles from laying eggs. This insect is very widely distributed through the United States. It attacks chiefly the apple, also fruit trees and different kinds of shade trees.—H. J. Quayle, Entomologist, Ag. Exp. Sta., Whittier.

### Para.

In your issue of October 7th, A. L. S. of Imperial inquires "how he can get rid of Bermuda grass?" Well he may inquire as the writer has never seen Bermuda thrive and seed as in Imperial valley. The writer, who takes great interest in the valley, would suggest that A. L. S. experiment by putting out a small plot in the infested field to Para cuttings (the seed at present not being obtainable) about one foot apart. I think that the Para will so shade and outgrow the Bermuda as to extirpate it and if so should yield as paying a crop as alfalfa. Para in itself is easily extirpated by a shallow plowing and then allowing to dry for a week. I am hoping to see this grass becoming of great value to Imperial county, where I have introduced it for the possible benefit to the desert and so far with promising results. It likes heat and plenty of water. The experiment may prove of much benefit and I will gladly furnish A. L. S. with the necessary cuttings through the Cultivator.—H. M.

MILWAUKEE Mayer CUSTOM MADE

F. MAYER BOOT & SHOE CO. MILWAUKEE WISCONSIN

WESTERN BRANCH: Washington Shoe Mfg. Co.—Seattle.

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point?"

MORE LIGHT

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

THE ANGLE LAMP

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

Boesch Lamp Co. 1135 Mission St. San Francisco

Established 1869. Incorporated 1890.

## THE MAN OF MANY PARTS.

HE was a shy-looking man of small stature, with watery blue eyes and nervous, twitching mouth; his age, anything between 30 and 50, for there was a singularly youthful expression about his smooth-shaven face that countless wrinkles belied on close proximity.

When I first saw him he was in his shirt sleeves, busily engaged in transferring a motley colection of scenery from a railway van to the interior of the local hall.

It was a windy day, and as I was passing a sudden gust drove a piece of scenery he was carrying into my face, which sent my straw hat bowling merrily down the road.

We both set off in hot pursuit, but I, being fleeter of foot, had secured it and was brushing away the dust when he arrived on the spot, puffing and blowing. "I—am—sorry—sir," he managed to ejaculate between gasps of breath. "I wouldn't have had it happen for fifty kroner."

I looked at him closely as he spoke, but there was no shade of satire in his voice. He was deadly in earnest.

Later in the day I met him again, still busy. This time he was delivering handbills relative to the great dramatic feats that were to take place that night within the four walls of Roskilde hall.

Opposite where I stood a marvelously realistic picture was plastered on the wall, which showed "The Temptress"—a highly colored young person in a very low-cut evening waist offering a glass of wine to a vacuous youth with canary-colored hair, whilst fluttering from her disengaged hand was a slip of paper labeled "poison."

At that moment the little man came up, smiling significantly as he caught the direction of my eyes.

"Don't miss it, sir," he said, casting a sidelong glance of admiration at the terrifying damsel. "Miss Julia Hammersly as 'The Temptress,' sir, supported by a powerful company of well known Copenhagen artists." His voice died into an awed whisper—then he pressed a bill into my hand and trudged cheerfully away.

As a visitor from the metropolis, I was not disposed to venture on any rash experiments—added to which, lurid drama holds no place in my affections; yet, somehow, I wanted to see my little friend again. He was so delightfully enthusiastic. Farther along the road I met others of the company—they looked cheap and shoddy, and were not delivering handbills, but loafing from a saloon.

I began to feel an intense respect for my little friend.

True to my prognostications, the hall was comparatively empty, and I sat in solitary state within touch of the footlights.

The interval between my arrival and the rise of the curtain was in a way relieved of monotony by furtive peeps into the auditorium from faces behind the act drop, and dismay was manifest. Roskilde is a notoriously "bad egg" for theatrical enterprises, and I began to feel sorry for Miss Julia Hammersly and her powerful company.

Presently a stout, florid gentleman bustled in from behind the screen and sitting down at the piano rattled off a few well known airs with startling rapidity. Then the curtain rose.

Of the drama I remember nothing, for my interest was centered on the little man with the shy, earnest face, who first appeared as a faithful servant in a wonderful dress suit that must have been dealt out to him by the good old master he spoke so frequently of, for its antique cut and curious bobtails gave him much the appearance of a dissipated cockatoo. In this he had a lot to say about the present squire that was more pointed than flattering, and was subsequently driven out of the house in which he had "served faithfully nigh on 50 years," by the squire himself with a hunting crop. This gave him an opportunity to don a slouch hat and stand at the head of the infuriated villagers to demand the whereabouts of Miss Elsie, the farmer's pretty daughter.

As no information appeared to be forthcoming he slipped off to appear as a constable in time to handcuff the heartless ruffian at the conclusion of the act.

When the curtain rose again he had lapsed into villainy as a blase roue and accomplice of Hilda, "The Temptress." He was singularly unadapted for this particular part, but struggled manfully to assert his claim to being "a very devil." Yet no black mustache or throaty ha, ha, ha could rob that mild little face of its natural inoffensiveness, and I confess to a sigh of relief when he went off to add to his list of crimes and returned as a sleuthhound of justice, "with a large pocketbook and side whiskers."

Perhaps his greatest triumph was as the broken-hearted father of Miss Elsie, enveloped in primitive frock coat and bereft of side whiskers, who had journeyed on foot to London and appeared to be seeking his lost child through the cracks of the stage.

He was a good old man and I felt genuinely sorry when his meditations on solitude were cut short by a knife-thrust from the wicked squire, who was then leading a very full life, assisted by "The Temptress" in varied costumes.

At this unhappy ending I began to think my little friend had at last completed his share of the night's bill; but not a bit of it, for there he was in the next scene as the French priest, breathing words of consolation to the dying Temptress, and, incidentally, receiving her confession. And again as the family lawyer bringing news of the legitimate heir, who had been spirited away by the base squire and his paramour.

And then—oh, shades of remorse!—his last effort was my undoing. I had sat patiently through nearly five acts, with a face stolid as the sphinx; but when he dashed on as the missing heir in a jaunty knickerbocker suit and pink cheeks to denounce the wicked squire, it was the last straw and I burst into laughter.

In a moment I checked myself, but it was too late, and I noticed with sorrow the look of anger directed, not at me, who deserved it, but toward the unfortunate property man, who had brought ridicule on the sorry exhibition.

Instinctively I knew the big pimply-faced villian was his master, and a hard one at that; the lean, callous-looking woman his mistress; the others fawning toadies, who would add their quota to aid his downfall.

Long after the doors had closed and the scant audience had dispersed I waited for his approach. He came at last, slowly and with stooping shoulders, like a man who had striven hard and failed.

"I want to congratulate you," I said, placing a friendly hand on his arm, "on a clever performance."

"I thought you was guying me in the last bit, sir," he repied, with faint suspicion.

"Not at all," I answered cheerily. "I was laughing at that big donkey who played the squire."

"And they all thought——"

He stopped abruptly, and his face wrinkled into a smile.

"I got the sack tonight," he went on, wistfully.

"You'd do better in Copenhagen," I began, impressively. "And if you won't think it too great a liberty from a comparative stranger, who imagines business has been none too good lately, I'd like to lend you this trifle until we meet again. "Good night!"

I glanced around when I got further up the road. He was still standing in the same position, gazing awe-struck at the banknote.

I felt glad I had helped the indefatigable little worker, and even better pleased to know I had raised him once more on to his pedestal of hope.

### POMONA RECIPES.

When at the Pomona picnic of the Claremont Farmers' Club we were so pleased with the good things that a number were asked to favor the Cultivator readers with the methods of the cooking. Not all replied, but a sufficient number that one may have an idea of the good things the Claremont picnickers are supplied with by their good wives.

**Nut Bread.**

One egg, ½ cup sugar, 2 cups milk, 5 cups flour, 4 teaspoons baking powder, 1 teaspoon salt, 1 large chopped walnut. Mix and let raise one-half hour. Bake three-quarters hour in bread oven.—Miss Grace Shoemaker, Claremont.

**Oat Meal Cakes.**

Two tablespoons butter, 1 cup sugar, 2 yolks eggs, 2½ cups rolled oats, 2½ teaspoons baking powder, 2 whites eggs. Cream butter, add one-half the sugar and yolks beaten with rest of sugar, then oats mixed with baking powder and salt. Add flavoring and fold in whites. Drop 1 teaspoon three inches apart on buttered pans.—Miss Grace Shoemaker.

**Date Cookies.**

Two eggs, 1 cup sugar, 1 cup butter, 1 pound dates cut up, ¼ pound walnuts chopped, 2 cups flour, 1 teaspoon soda sifted with flour. Drop 1 teaspoon three inches apart on buttered cooky tins.—Miss Grace Shoemaker.

**Carrot Salad.**

One onion grated, 2 large cups grated carrot, 1 small cup ground walnut meats, salt and pepper to taste. Mix with a boiled dressing. The addition of a little chopped celery is nice in celery season. Serve in lettuce leaf. Boiled dressing: ½ cup vinegar, 2 tablespoons melted butter, 2 tablespoons sugar, ½ teaspoon salt, 1 tablespoon mustard. When hot add 2 eggs well beaten. Stir fast on fire until thick. When cold add 2 tablespoons thick cream. This amount of dressing is sufficient for two salads. It will keep for a month.—Mrs. Wm. S. True, La Verne.

**Oat Meal Cookies.**

One cup lard or butter, 2 cups sugar, 3 cups oatmeal, 1 cup sour milk or butter milk, 2 eggs, 1 teaspoon soda, 1 pound of raisins chopped fine, ¼ teaspoon salt, enough flour to roll out about ¼ inch thick. These are fine for picnic or lunch baskets.—Mrs. Wm. True.

**Salmon Loaf.**

To 1 can of salmon add 1 cup of milk, 1 beaten egg and 6 soda crackers, rolled fine. Season with salt and pepper, make in long loaf, dotting top with butter and bake half an hour. Garnish with parsley and serve with sliced lemon.—Mrs. Jennie A. LeRoy.

**Nut Loaf.**

1 cup of ground walnut meats,
1 cup of mashed potatoes,
1 cup of fine bread or cracker crumbs,
1 cup of milk,
1 egg.

Season with salt and pepper and make into loaf. Pour over top, 3 tablespons melted butter, and bake one-half hour.—Mrs. Jennie A. LeRoy.

**Tutti Frutti Jelly.**

Make two quarts of lemon jelly by directions in box of Knox's gelatine, then add ripe strawberries, cherries, blanched almonds, and walnut meats. Set in a cold place over night before using. If cherries are not in market, used canned ones.—Mrs. Jennie A. LeRoy.

**Archangel Cake.**

Whites of 8 eggs well beaten,
1 cup sugar,
1 cup butter,
2 cups of flour sifted four times,
2 even teaspons of baking powder.

Bake in a slow oven for 50 minutes. Ice cake with boiled icing flavored with ½ teaspoon of vanila and ½ teaspoon of lemon.—Mrs. Jennie A. LeRoy.

**Ginger Snaps.**

1 cup molasses,
1 cup sugar,
1 cup shortening.

Boil these together until quite thick, then add 1 teaspon of cinamon, 2 teaspoons of ginger, 1 teaspoon of salt and ½ of cloves. 2 eggs and 2 small teaspoons of soda dissolved in a very little milk or water.

Flour enough to roll. Roll thin and bake in quick oven.—Mrs. Jennie A. LeRoy.

**Unleavened Bread.**

Graham or whole wheat flour sufficiently mixed with cold water, or better, cold milk. The milk or water must be very cold. A well beaten egg may be added if wished. Mix quickly and drop in little hot pans—very—hot—and place at once in very hot oven.

Add no salt, nor baking powder, nor other ingredient than given above. Putting the cold mixture in the hot oven does the work and a light, healthful bread or "gem" results.—Mrs. Lorbeer.

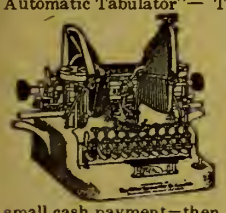
# A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



## Yours for 17 Cents a Day!

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

## A Quarter of a Million People are Making Money With

The—— OLIVER Typewriter

## The Standard Visible Writer

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

**"An Oliver Typewriter in Every Home!"**

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

**The Oliver Typewriter Company**

CONGO
NEVER LEAK
ROOFING

Our Guarantee

THE advantage in buying Congo Roofing (3-ply) is that you can be absolutely sure of getting protection from sun and rain for ten years. There is no guess-work about it. With every roll of 3-ply Congo comes a blank Surety Bond Guarantee numbered and ready for our seal and signature as soon as your roof is laid. The guarantee states that if you need a new roof inside of ten years you will get it free and that the National Surety Company will see to it that you get it (or its equivalent in cash). It is a legally binding and instantly enforceable document—a real contract such as your own lawyer would draw up for you. Every possible contingency is provided for. Every fair protection is given you. It is the only such guarantee that applies to any ready roofing today! Other guarantees are mere non-enforceable statements that would prove worthless in a lawsuit. But the Congo guarantee is a real guarantee, and it makes you absolutely sure of the amount of service you will get for your money.

When you buy other roofings you buy roofing material whose probable durability is vague and indefinite. When you buy Congo (3-ply) you buy ten years of assured protection, and the guessing does not begin till after the guarantee term expires.

Why buy a Roofing Riddle when you can (just as cheaply) buy a Congo certainty?

UNITED ROOFING & MFG. CO.

567 West End Trust Bldg., Philadelphia, Pa.

Chicago San Francisco

Blake, Moffitt & Towne, Los Angeles, Agents.

Alexander Gordon of the Sacramento State Bank in an address before the Fresno Realty Board, declared that the grape growers should organize for their self protection. He thought at least 65 per cent of the total acreage must be signed up to make any kind of success.

## San Francisco Markets

SAN FRANCISCO, Nov. 2, 1909.

### Butter.

Butter has declined a cent and a half on extras and firsts other grades remaining as they were last week.

| Light Amber | 10@12 |
| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week just past have been 2500 tons. The larger proportion of this amount arrived by water, therefore it can readily be seen that arrivals by railroad have been decidedly moderate.

There has been no decided change in prices during the last ten days. Under very light arrivals of horse hay, prices have continued practically unchanged, but if any thing they are a little weaker than they have been heretofore.

The railroad companies recently have not been able to furnish the transportation demanded at various large hay centers, as their cars have been busy in other lines, and there is considerable dissatisfaction recently on account of the railroad company not being able to suply cars enough to move what hay was offering for shipment to the San Francisco market. However, it has been a good thing generally that arrivals have been so moderate, for if shipments to this market had continued heavy, the current prices could not have well been maintained.

The San Francisco Hay Association is at the present time preparing statistics of the stocks of hay on hand in private barns throughout the territory in Central California, tributary to the San Francisco market.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 1900@20.00 |
| No. 1 wheat or wheat & oat | 17.00@18.00 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.50@17.50 |
| Other tame oats | 14.00@15.00 |
| New crop wild | 11.00@15.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.00 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.75@1.80 |
| Barley No. 1 | 1.40@1.46¼ |
| Oats white | 1.57½@1.65 |
| Oats gray | 1.57½@1.65 |
| Rye new crop | 1.75@1.85 |
| Cal sm round corn | 1.70@1.75 |
| Alfalfa seed | 16@18 |
| Mustard brown | 3¾@4½ |
| Millet | 2½@3 |
| Flaxseed | 4 |
| Broom corn seed per ton | 23.50 |

### Feed Stuff.

|---|---|
| Bran per ton | 29.00@30.00 |
| Feed cornmeal per ton | 38.00@39.00 |
| Cracked corn per ton | 39.00@40.00 |
| Ground barley per ton | 29.50@31.00 |
| Rolled oats per ton | 37.00@38.00 |
| Oil cake per ton | 38.50@40.00 |
| Cocoanut cake per ton | 25.00 |
| Middlings | 36.00@37.50 |
| Mixed feed per ton | 28.00@32.00 |
| Shorts | 31.50@33.00 |

## Deciduous Market

SACRAMENTO, Nov. 1, 1909.—The California Fruit Distributors has received reports today of fruit sales in the East as follows: 17 carloads sold at Chicago, 7 by Distributors; 8 in Boston by Distributors; 8 in Philadelphia, 6 by Distributors; 3 in Minneapolis, 2 by Distributors; 1 in St. Paul by Distributors; 1 in Buffalo by Distributors; 4 in St. Louis, 3 by Distributors; 6 in Pittsburg, 4 by Distributors.

Fruit prices averaged as follows:

Boston—Tokays, $1,12; Double, $2.85; Cornichons, $1.15; Muscats, $1.30, Ferrears, 95c; quinces, $1; Malagas, $1.20.

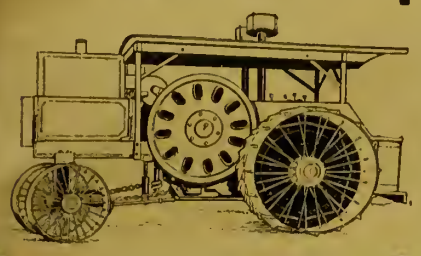
Chicago—Tokays. 70c to $1.35; Malagas, $1.25; Cornichons, 70c to $1; Emperors, 90c to $1.35.—Sacramento Bee.

## Citrus Market

LOS ANGELES, Nov. 3, 1909.

The orange shipping season ended with Sundays' shipments, the total of both oranges and lemons running to 38,071 cars, which is somewhat short of the 40,000 predicted earlier in the season. This is by all odds the greatest shipment of citrus fruits ever seen by California and of course much greater than next year's output. Considering this vast shipment, the prices received have been very satisfactory. No record prices have been secured, but season through, the fruit has so been distributed and market conditions so studied by those in charge of distribution, that general satisfaction prevails.

**Distillate Traction Engine**



**Double Cylinder 50 H.P.**

IT DOES THE WORK

H.H. MOORE & SONS, MFG'RS. AND PROPRIETORS STOCKTON CALIF

The Valencias were not entirely cleaned up before the end of the year, but the straggling cars remaining will probably be cleaned up befor Saturday night of this week. Quality remains exceptionally good and prices received are satisfactory at this writing.

Lemons are increasing slightly and the price promises to hold to the present satisfactory figures. Shipments range from four to five cars per day.

**Shipments.**

Total shipments of all citrus fruit for the year beginning Nov. 1, 1908 and ending October 31st, 1909; 38,071 cars of which 31,886 cars were oranges and 6135 lemons.

Total shipments for the preceding year were 29,498 cars of which 24,540 were oranges and 4958 were lemons..

For the years 1906-1907 shipments were 27,493 cars of which 23,986 were oranges and 3507 lemons.

The new year started Monday with nine carloads oranges and four carloads lemons, or a total of thirteen.

# Business Notes

**THIRTY-ONE MILES OF PIONEER ROOFING.**

The Pioneer Roll Paper Company, manufacturers of Ready Roofing, Roof Paint and Insulating Papers—whose factories are located in Los Angeles—recently received an order from the Associated Supply Company, of San Francisco, for 400,000 square feet (31 miles) of 32-inch Roofing—to be used in covering their large oil reservoirs in Kern County. The size of this order, and the source from which it came, is certainly a strong endorsement of the quality of Pioneer Roofing.

We are advised that the Pioneer Roll Paper Company will be glad to send their 32-page illustrated booklet on Roofs and Roofings to anyone who will write for it, mentioning this publication.

---

**OF VALUE TO HORSEMEN.**

Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsom applied as per directions, just as you are turning the horse out, will be of great benefit; and this is the time when it can be used very successfully. Of course it can be use with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

---

**NEARLY $600,000,000 A YEAR.**

That there are yearly losses to the farm products of the country chargeable to insect pests aggregating $595,100,000; and that these losses are due, directly, to the alarming decrease of birds, which kill the insects, are the statements made by Reginald Wright Kauffman, who has undertaken a serious and exhaustive study of bird extermination and its causes, in the current number of Hampton's Magazine.

Of interest to everybody who suffers from an advanced cost on producing crops due to devastation by insects—this article is of special importance to farmers, for it tells the farmers just where they are losing an amount of money exceeding the annual expenditures of the national government—and it tells them just why.

The farmers of the country have suffered losses, due to the increasing hordes of destructive pests. In the face of these armies of insects, worms and scales, the farmer often stood helpless; unable to cope with them. He saw his corn, hay, tobacco, fruit and truck crops perish. Year by year, unknown to him, the birds—the only effective battling legion against these pests—have been decreasing! They were being wantonly slain to satisfy the demands of woman's vanity.

Because of this slaughter of birds the losses to the farmers have reached the present appalling figures. Government statisticians now estimate that there is a yearly loss of $200,000,000 on the country's cereal crop, including wheat, rye, barley, etc.; of $53,000,000 on hay; of $53,000,000 on truck crops; of $27,000,000 on fruits, and of $175,000,000 on animal products, and, including other farm products, an aggregate of nearly $600,000,000 which might be added to the farmers' bank rolls—if the birds were properly protected.

An even more amazing fact is brought out by Mr. Kauffman—that this slaughter of birds is an unnecessary, brutal and costly tribute to the vanity of women. Most of these birds are killed to trim hats. Entire species of birds have been exterminated. Species of insects were consequently enabled to increas until, for example, one of many hundreds—the Hessian fly—now demands a yearly tribute of $20,000,000 worth of grain.

What can be done? That it is time for the farmers to take action, to demand legislation which shall protect the birds and save our crops Mr. Kauffman conclusively shows.

---

Portland, Oregon, hop growers are gleeful over the prospect of hop prices soaring this year owing to a shortage in Germany and England. Exports are expected to be heavy and prices correspondingly large.

The red apple harvest of the Rogue River country is in full blast and thousands of boxes of apples are being packed for the market.

# "Without a Peer"

says one of our customers, writing regarding his WESTERN engine. Extract from his letter is given below:

"It pleases me greatly to be able to say that the engine recently purchased of you has more than met our highest expectations. Of its kind, it is my belief that it is **Without a Peer** in all the West.

In the purchase of the engine I carefully looked over the market, had seen every high powered combustion in the State, had given every argument due weight, had fully considered costs of other powers—both as to first cost and cost of operation—and now after a good test stand ready to say that I do not think we have made a mistake in securing your engine."

The engine referred to is of the size and type shown in cut, and is used for pumping water near San Francisco, Cal.

# The Smooth Running, Noiseless Pomona Deep Well Pump

It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

# Select Your Fruit Trees Now

Below we list in brief some of the Fruit Trees and Vines contained in our this season's stock. This does not show our complete line but represents a collection of the best standard varieties. The descriptions given in this announcement are necessarily in an abbreviated form. Our catalogue gives full details concerning each variety, together with our personal observations and recommendations. The dates given after descriptions are the period of ripening. We are selling out fast in some varieties.

**SELECTED STOCK.** Our long experience as fruit growers, fruit shippers and nurserymen enables us to determine what varieties of fruit are best to ship, best to grow; best from a seller's standpoint and best from a grower's standpoint, and in propagating we cut our buds and scions only from parent trees that are the best specimens of their kind for productiveness and quality of fruit.

**THRIFTY AND EXCEPTIONALLY HARDY.** We grow our trees only on virgin soil, never cropping the same land a second time. Our decomposed granite soils produce exceptionally well meshed root systems and bright, highly colored well toughened wood fibre, thus producing a tree more hardy and one that will bear transplanting better than trees grown on river bottom soils such as are commonly used by nurserymen.

**TRUE TO NAME.** All buds and scions are cut by our nursery foreman from trees that have been under his personal observation and that are marked for this purpose when they are in fruit, and we exercise every care known to avoid the possibility of an error. You can rely that our stock is not only true to name, but is propagated from the best of its kind.

**ORDER NOW.** Do not wait until you are ready to plant before making your selection. Order now and thus be assured of just the varieties you desire. We are selling out fast in the most desirable varieties, so do not delay. Give the matter careful thought and consider what is best suited for your locality and best for profit. If undecided, consult some successful orchardist or write us and we will gladly give you the benefit of our experience.

# THE BEST COMMERCIAL VARIETIES

### APPLES.

**Yellow Transparent,** yellow, flesh white, an excellent early variety, June.
**Early Harvest,** good for eating or cooking, last of June.
**Red June,** abundant bearer, June.
**Red Astrachan,** large, fine eating, excellent for dessert, the main reliance for an early apple, July.
**White Astrachan,** very large, fine for cooking, July 15th.
**Gravenstein,** large, skin yellow, fine flavor, the best apple of the summer season, August and September.
**Alexander,** large, cooking, a profitable variety, August 15 to September 15.
**Arkansas Black,** November to March.
**Baldwin,** a fine winter apple, November to January.
**Ben Davis,** very prolific, November to January.
**Grimes Golden Pippin,** fine quality, good keeper, December to March.
**Jonathan,** good for table or market, November to January.
**Mammoth Black Twig,** good size, November to March.
**Missouri Pippin,** good market variety, November to March.
**Rambo,** medium to large, November to December.
**Rhode Island Greening,** an old standard, October to January.
**Spitzenburg,** the best and most profitable winter variety, November to April.
**Winesap,** one of the best standard varieties, November to February.
**Yellow Newton Pippin,** wonderful keeper, fine quality, very profitable, October to May.
**Crab Apples. Red Siberian and Yellow Transcendent.**

### PEARS.

**Bartlett,** the king of pears, a great money maker; we recommend for extensive planting; July 1st to September 15th.
**Beurre Clairgeau,** prolific, good quallty, August 1st to September 15th.
**Doyenne de Comice,** a fine fall pear and very profitable for some localities. October 15th to November 15.
**Winter Nells,** profitable variety, September to October.
**P. Barry,** valuable winter pear, October to January.
**Glout Moreau,** good variety, fine flavor, large, October to January.
**Easter Beurre,** good keeper, very large, splendid for dessert, October to March.

### PEACHES.

#### FREESTONE VARIETIES.

**Alexander,** profitable on account of early bearing, June 8 to 20.
**Triumph,** the first yellow peach, the best of the early peaches, and planted extensively by ourselves, June 12 to 30.
**St. John,** profitable early yellow freestone, June 28 to July 15.
**Early Crawford,** standard profitable variety, July 10 to 27.
**Foster,** good for canning, drying or shipping, July 15 to 31.
**Elberta,** a fine peach, good for canning or drying, excellent shipper, the standard mid-summer variety, planted extensively by ourselves, July 21 to August 6.
**Fay Elberta,** an improved Elberta. Its firm, fine grained texture, makes it superior to Muir or Lovell for canning and also an improvement over Elberta for its shipping quality, being as productive and regular in bearing as the Elberta and better than any peach. Now the most desirable mid-summer peach for all purposes. We plant them extensively ourselves and we heartily recommend this variety. Canned it does not rag out. July 31 to August 20.
**Late Crawford,** an old standard, July 24 to August 13.
**Susquehanna,** old standard, July 22 to Aug. 15.
**Muir,** a splendid drying and canning freestone, July 27 to August 15.
**Lovell,** prolific, good for shipping, drying or canning, August 5 to 20.
**Picquett's Late,** regular bearer, good all-round peach, August, 15 to 25.
**Salway,** the best late peach, August 25 to September 15.

#### CLINGSTONE VARIETIES.

**Tuscan Cling,** early, prized by canners, July 13 to 27.
**Runyon's Orange Cling,** splendid for canning, August 5 to 20.
**Phillips Cling,** the best for canning, August 26 to September 15.
**Levi,** good bearer, good for Eastern shipment, desirable for canning, Sept. 2 to 25.

### PLUMS.

**Clyman,** earliest Plum for distant shipping, June 3 to 17.
**Tragedy,** good money maker for some sections, a fine Plum, June 10 to 17.
**Climax,** Burbank's King of early Plums; planted extensively by us and recommended as best early Plum for profit; June 15 to July 3.
**Santa Rosa,** best of Burbank's recent creations, June 25 to July 15.
**Burbank,** good, profitable and prolific, June 28 to July 15.
**Wickson,** a good variety, July 10 to 25.
**Green Gage,** fine flavor, good canner, July 10 to 20.
**Kelsey,** a profitable shipper, July 20 to August 10.
**Sugar Prune,** good for shipping or drying, July 20 to Aug. 5.
**Bradshaw,** old standard, profitable, July 10 to 25.
**Imperial Prune,** strong and productive, valuable drying variety, July 25 to Aug. 5.
**Diamond,** vigorous grower, very productive; planted extensively by ourselves; very profitable and one of the best mid-summer Plums for Eastern shipments; July 15 to August 5.
**Jefferson,** good for canning, August 1 to 15.
**Fnllenbnrg,** a fine late variety, August 1 to 15.
**German,** a standard, late shipper, August 15 to September 1.
**Yellow Egg,** good for canning, drying and Eastern shipment, August 1 to 10.
**Giant,** a splendid Eastern shipper, August 1 to 15.
**Grand Duke,** a fine large Plum, and profitable, planted extensively by ourselves, August 10 to 20.
**French Prune,** the standard for drying, August 25 to September 15.

### CHERRIES.

**Early Purple Guigne,** earliest marketable Cherry, April 20 to May 1.
**Knight's Early Black,** earliest good cherry, April 25 to May 10.
**Early Chapman,** large black, good shipper, early, May 1 to 10.
**Black Tartarian,** standard black cherry, profitable shipper, May 7 to 25.
**Bing,** fine, large black cherry, May 18 to June 5.
**Royal Ann,** the standard canning cherry and an excellent shipper, May 18 to June 10..
**Black Oregon,** favorite for distant shipping and good money maker, May 26 to June 15.
**Lambert,** large black cherry, excellent shipper, June 5 to 20.

### APRICOTS.

**Royal,** splendid for drying and shipping, June 1 to 20.
**Blenheim,** prolific bearer, highly prized by canners, fine quality, good dryer and good shipper June 15 to 30.
**Routier's Peach Apricot,** June 20 to 30.
**Tilton,** a late bloomer, fine quality, good bearer. June 15 to 30.
**Hemiskirk,** very hardy, regular bearer, June 20 to 30.
**Moorpark,** a fine large 'cot, June 25 to July 10.

### QUINCES.

**Orange,** standard variety, vigorous and productive, September 5 to Oct. 15.
**Rea's Mammoth,** a fine large quince, September 15 to November.
**Champion,** excellent quality, good size, October 1 to November.
**Pineapple,** bears young and regularly, productive September 1 to October 1.

### PERSIMMONS.

**Hachiya,** large and handsome fruit, prolific, October and November.
**Tsurunoko,** rapid grower, good bearer, one of the best, October and November.
**Hyakume,** early, large, prolific, October and November.
**Dai Dai Maru,** one of the best for eating, prolific, October and November.
**Tane Nashi,** very fine fruit, productive, standard variety, October and November.
**Goshio,** very productive, one of the best for quality and market, October and November.
**Mammoth Goshio,** new production, extra large fruit, October and November.

### GRAPES.

**Fontainblenu,** valuable as earliest shipping grape, July 1 to Aug. 15.
**Thompson Seedless,** good shipper and drier, Aug. 5 to 20.
**Black Prince,** best early black grape, Aug. 12 to Sept. 5.
**Rose Peru,** good bearer and profitable black grape, Aug. 12 to Sept. 5.
**Blue Malvoise,** an excellent grape for certain localities, August 18 to Sept. 1.
**Mnlaga,** the best white grape for Eastern shipment.
**Purple Damascus,** attractive grape and good shipper, Aug. 25 to Sept 10.
**Tokay,** table grape of profitable standard, Aug. 18 to Nov. 1.
**Black Morocco,** fine, large black grape, good bearer, Sept. 3 to Oct. 15.
**Cornichon,** large oval fruit, good shipping quality, Sept. 6 to Nov. 1.
**Black Ferrera,** delicious table grape of valuable market variety, Sept. 5 to Oct. 15.
**Emperor,** desirable market variety, Oct. 15 to Nov. 15.

### ORANGES.

**Washington Navels,** the most popular grown orange, very hardy and prolific bearer.
**Thompson Improved Navel,** a good keeper, valuable as a good shipper.
**Valencia Late,** a fine orange, late keeper, being in prime condition when other varieties are out of markct.

### LEMONS.

**Eureka,** a good keeper and very popular.
**Villa Franc,** considered to be the best of all lemons, will stand a lower temperature than any other variety.

### POMELO.

**Marsh's Seedless,** rich meat, good keeper, popular variety.

### NUT FRUIT.

#### ALMONDS.

**Drake's Seedling,** medium hard shell, abundant and regular.
**IXL,** soft shells, perfect; highly recommended.
**Ne Plus Ultra,** soft shells, heavy, regular bearer.
**Nonpareil,** paper shell, one of the best.
**Peerless,** fine, popular variety, large nut.
**Texas Prolific,** wonderfully productive.

#### WALNUTS.

**Ford's Improved Soft Shell,** thin shell, sweet kernel.
**Franquette,** a late bloomer, nuts command the highest market value.
**Mayette,** fine dessert nut and sure bearer.
**Santa Barbara Soft Shell,** a favorite variety in Southern California.

#### PECANS.

**Paper Shell,** nuts of superior quality
**Stewart,** standard commercial variety, very profitable.

### FIGS.

**White Adriatic,** the standard white fig.
**Calimyrna,** the best of Smyrna varieties.
**Capri,** to fertllize the Smyrna varietles.
**Mission,** the best black fig.
**San Pedro,** fine, large black fig, good flavor.

### OLIVES.

**Manzanillo,** very large, fine for pickles and oil.
**Mission,** a fine, large olive, most largely grown in California.

### BERRIES.

#### RASPBERRIES.

**Hnazel,** early, a good shipper, May 22 to June 15.
**King,** good size, an excellent shipper, June 2 to 28.
**Cuthbert,** large, a good shipper, June 10 to July 1.

#### STRAWBERRIES.

**Dollar,** the best market berry; first crop, April 28 to June 5; second crop, June 11 to Oct 1.

#### BLACKBERRIES.

**Lucretia Dewberry,** earlest and best Blackberry, fine flavor, very prolific, June 1 to July 5.
**Lawton Blackberry,** large, black, excellent quality, best late Blackberry, June 25 to Aug. 15.

#### LOGANBERRIES AND PHENOMENAL BERRIES.

Both fine, large berries, combining the flavor of both raspberry and blackberry, splendid for dessert, jelly or jam.

#### GOOSEBERRIES.

**Oregon Champion,** very large fruit, brownish, profitable, for canning.

#### CURRANTS.

**Cherry,** large, deep red, fine for preserving, valuable market variety.
**Fay's Prolific,** very large, prolific and profitable.
**White Grape,** large yellowish white.

---

OUR CATALOGUE is more than a catalogue in one sense of the word for the reason that, besides listing all the Fruit Trees, Vines, etc., that we sell it contains many valuable hints on The Time to Plant; How to Plant; Cultivation; Common Fruit Pests and Their Treatment, as well as the necessary remedial solution and formulas for the purpose. We shall be glad to mail this catalogue free to all who wish, whether they intend to purchase or not. Write today; the information it contains may save you many dollars.

OUR PRICES are reasonable. Though they may not be the cheapest, yet the cheapest is not always the best.

OUR TREES are the best that care in selection and growing can produce.

Cut off the coupon and mail today.

# California Cultivator

Vol. XXXIII—No. 20 Los Angeles, California, Thursday, November 11, 1909 Subscription $1 a Year

# An Address on Control of Tuberculosis of Cattle

By Prof. A. R. Ward, Veterinarian and Bacteriologist, Agricultural Experiment Station, University of California, at the State Farm, Davis, October 29, 1909

TUBERCULOSIS is recognized as an infectious disease caused by the germs of tuberculosis. The spread of the disease among cattle is governed by the conditions that permit the transfer of the germs of tuberculosis from the sick animal to the healthy ones. In the vast majority of cases calves are born free from tuberculosis, that is, the disease is not inherited.

The problem of the control of tuberculosis in cattle concerns itself with the means necessary for keeping separate animals that are spreading germs and hence dangerous, from those which have not been contaminated by the disease.

The earliest method employed for the detection of tuberculosis in cattle is that known as physical examination. This method consists of a careful search of the animal for enlarged glands or evidence of lung disease. In cattle its usefulness is very limited and its application practically results only in the detection of animals that are in the last stages of the disease. An overwhelming amount of evidence shows that animals may be seriously diseased in the sense that they are giving off the germs of tuberculosis, and hence dangerous, without presenting evidence that would lead to their detection on physical examination.

The use of the tuberculin test for the detection of tuberculosis in cattle makes possible the detection of a much larger percentage of tubercular animals than is possible when mere physical examination is used. The test makes no distinction between slightly and extensively diseased animals, that is, it is a qualitative and not a quantitative test. Therefore, after a tuberculin test, we can only conclude that certain animals have reacted to this test and may be either slightly or extensively diseased.

This is no drawback, for an animal may be slightly diseased this month and extensively diseased a few months hence. From the standpoint then of controlling the disease, it is just as necessary to detect the slightly diseased ones as those which are spreading the germs of the disease at the moment. The number of animals reacting to a tuberculin test, therefore, is always larger than would be naturally expected, if one judges the matter merely from the standpoint of the amount of visible tuberculosis in the herd.

If we are to depend upon the tuberculin test for selecting tubercular animals from a herd with a view to their separation, it behooves us to scrutinize carefully the accuracy of the test and its limitations under various conditions.

The test has been under trial for at least fifteen years and has during that time been subjected to heated criticism. Belief at present is unshaken that the tuberculin test is a wonderfully accurate method for determining the existence of tuberculosis in an animal, that is to say, a very large percentage of cases which show that peculiar rise in temperature after injection of tuberculin, which we regard as a practical reaction to the tuberculin test, will, upon slaughter, show evidences of the disease. In something less than five per cent of reacting animals, we fail to find evidences of the disease. This is not surprising, for there is evidence to show that an animal may react to the tuberculin test as a result of the presence of a diseased mass so small that it cannot be detected after the slaughter of the animal. There is a case on record of an experiment made to determine how soon after the injection of tubercle bacilli an animal will react to the test. A reaction occurred within fourteen days after the injection of tubercle bacilli and upon slaughter no evidence of disease could be found. It is therefore fair to assume that the animals in question had the form of tuberculosis so minute that the disease could not be detected, nothwithstanding the fact that the animals had reacted to the test.

It remains for us to consider the accuracy of the tuberculin test from the standpoint of the truth of the conclusions drawn from the fact that an animal fails to react. In other words, is the tuberculin test as accurate in its negative conclusions as it is when positive conclusions are drawn from the test? Is the test as searching as we would like to have it? Does it reveal all the tuberculosis in the herd?

In the course of experience in the use of the tuberculin test used to separate tuberculous from non-tuberculous animals with a view to control the disease, a number of interesting facts have been developed.

First: A cow may be extensively affected with the disease and will not react to the test. The statement is generally made that such animals may be detected on physical examination. There are certain cases, however, where it is extremely unlikely that the existence of the disease would be detected in a non reacting animal. If the disease is not present in the lungs or in those lymphatic glands which are located immediately beneath the skin, and hence readily accessible to the touch, there is little likelihood that the disease would be recognized.

Second: In purchasing an animal on the tuberculin test, there is the danger that the animal may pass the test and later develop sufficient disease to cause reaction to the test. There is a period shortly after the germs of tuberculosis have entered the system during which the animal will not react to the tuberculin test. In such a case, the test is no protection against the introduction of the disease.

Third: In a tuberculous animal the injection of a dose of tuberculin causing a reaction, will leave the animal in such a condition that it will not give another reaction to a dose of tuberculin until a considerable time has elapsed. It has been generally considered that the second test will be successful if given at least six weeks after the first one. From my experience I have encountered several cases like this. Five animals were tested with positive results. Six weeks later four of these were retested with negative results. Eight months later they were all retested but only two reacted. The animals in question were all slaughtered after the last test and the existence of tuberculosis was demonstrated in each. This is a small amount of experience from which to draw general conclusions, but I may say that evidence of this kind should be indefinitely multiplied from the experience of others.

The lessons to be drawn from these facts are as follows: When an animal has once reacted to the test it should be regarded ever afterwards with suspicion. One must not expect to verify the accuracy of the tuberculin test by demanding that the animal react twice in succession. Six weeks is not a long enough period between tests.

Fourth: An animal may fail to react to the test owing to the temporary arrest of the disease. In cattle as in man there is a very strong tendency toward recovery from infection with disease. Nature tends to inclose diseased areas within a wall of fibrous tissue which does, temporarily at least, check the progress of the disease. This healed up area may, however, harbor live tubercle bacilli in the interior. Slaughter of animals with arrested tuberculosis has permitted us to demonstrate live tubercle bacilli in the partially healed spot, even though the animal did not react to the test.

Thus a cow may react today as the result of active progressive tuberculosis and later may not react because nature has temporarily overcome the disease. The progress of the disease may remain thus arrested for years and then again break out in progressive form, when it will cause a reaction to the test.

It has long been recognized that one tuberculin test with removal of reacting animals followed by thorough disinfection of the stable, will not check the progress of the disease in the herd. This circumstance was formerly attributed to poor disinfection or the accidental introduction of infection through gross carelessness. This all might occur, but there certainly have been cases conducted under the supervision of experts, in which these errors did not occur, and under such circumstances the blame is laid upon the non-reacting tubercular cow in which the progress of the disease has been temporarily checked. Moore has made a special study of the behavior to successive applications of the tuberculin test to the animals which did not react to the first application of the test applied to a badly infected herd.

This herd of 491 animals showed only 96 that did not react to the test. That is, 80 per cent of the animals did react. These non-reacting animals were placed by themselves and thoroughly isolated from the possibility of infection. They were tested three months after the first test and every six months thereafter. In each cas the reacting animals were promptly removed and the stable disinfected.

The results are presented in the following table:

| Date | No. Tested | No. Reacted | No. Not Reacting | Per Cent Reacting |
|---|---|---|---|---|
| 1904 July | ---96 | 31 | 65 | 32.2 |
| 1905 Jan. | ---65 | 8 | 57 | 12.3 |
| 1905 July | ---57 | 15 | 42 | 26.3 |
| 1906 Jan. | ---42 | 15 | 27 | 35.7 |
| 1906 July | ---27 | 3 | 24 | 11.1 |
| 1907 Jan. | ---24 | 2 | 22 | 8.3 |
| 1907 July | ---22 | 1 | 21 | 4.5 |
| 1908 Jan. | ---21 | 1 | 20 | 4.7 |
| 1908 Aug. | ---20 | 1 | 19 | 5.0 |

The conditions were such in this experiment that we must regard the appearance of reaction among the animals in this herd as due in each case to renewed activity of the disease in an infected area which had become temporarily healed previous to the very first test. The post mortem examination of such of the animals as were killed bore out this conclusion.

# Citrus and Sub-Tropical Fruits

## WITHERTIP.

By Prof. A. J. Cook, Pomona College.

DURING the last two or three years a new disease has appeared in our citrus orchards. It is the old, well known withertip of Florida. It attacks all kinds of citrus trees. It is probable that it is affecting many orchards without being known or recognized at all.

The disease pits the fruit; causes the leaves to fall, and the terminal twigs to wither. In some orchards it has done serious harm, and would have become very much more serious had it not been discovered and the remedy applied. Here, as in many other places, the Department of Agriculture has come to our rescue and has been indeed the good angel. The remedy for this is the Bordeaux mixture, which is exceedingly effective. The insecticide need not be strong, and so the remedy is not an expensive one; and when we take into consideration what it will save to the grower, no one who is financially interested can afford to neglect it.

I know of cases where the trees were suffering very severely and were treated at quite a considerable expense, but now there is no appearance of the disease. The trees have their full vigor, and the prospects for next year's crop are exceedingly encouraging. The indications of this fungoid trouble are dropping leaves, withered and dying twigs and pitted fruit. It is a threatening malady and we rejoice that it is so easily and surely overcome.

## HUMUS AS A SOIL IMPROVER.

By A. W. Blair, Florida Experiment Station.

The dark-colored material that we call humus consists of partly decayed organic matter, either animal or vegetable. Stubbs, grass, roots, cornstalks, cotton stalks, and the like are not humus; but these materials when turned under the moist soil soon begin to decay and fall to pieces, and it is then that humus is formed. This process of decay and humus formation goes on as long as the conditions are favorable and there is any organic material left. Humus may be called an intermediate product, for under favorable conditions the process of decay goes on until there is no longer any vegetable or animal substance left, nor yet any humus; but instead, water, gases that escape into the air, and a small amount of mineral matter. We thus see why it is that we need to renew the supply of humus from time to time. If a crop of velvet-bean vines is turned under in the winter or early spring, and an examination is made in April or May, much of this decaying matter or humus will be found. If now a crop of corn or cotton is grown during the summer, and the land thoroughly cultivated, it is probable that none of the humus would be seen if an examination should be made in September. It does not follow, however, that all the humus has been used up, but it has been so thoroughly incorporated with the soil that the eye does not detect it, except that the land would look darker. During all the time the humus was gradually being transformed into simpler compounds, it was serving its purpose.

### The Uses of Humus.

Humus improves the mechanical condition of the soil, by making it looser and mellower; it increases the water-holding capacity, and thus the plant-food holding capacity of soil; it furnishes food for useful micro-organisms, which in turn convert the nitrogen of the organic matter into a form that is available for the crops; it aids in bringing into solution difficultly soluble minerals that contain plant food; and it yields a small amount of mineral plant food itself.

If one would get a good idea of the value of humus, he need only compare fields where a legume crop has been grown as part of a system of rotation, and where stable manure has been used liberally, with those fields where corn and cotton have been grown steadily year after year on commercial fertilizers. The latter are devoid of humus, and have lost much of their power of holding water and plant food. The value of humus is also emphasized where an old barn or house has been left standing in the middle of a field. Around these the crops are usually much superior to those on the surrounding portions of the field.

### Humus and Sandy Soils.

Sandy soils, on account of their open, leachy condition, are especially in need of a good supply of humus. Furthermore, the conditions in Florida favor a rapid disappearance of the humus. This "burning out" of the humus is caused by certain bacteria, and whatever is favorable to their development hastens the destruction of the humus. Warmth, moisture, and a good supply of air are conditions which favor bacterial development; and since these conditions are fulfilled to an unusual degree in Florida, it follows that the humus will disappear with more than ordinary rapidity. In such soils it is necessary to supply humus-forming materials more often than it is in a heavy clay soil.

This loss of humus is compensated for by the production of nitrates as the humus disappears. Analyses of some pineapple soils have shown that samples taken from surfaces where vegetable matter is decaying, are much richer in nitrates than those taken from clean bare surfaces, or from the subsoil where there is but little organic matter.

### How Humus May Be Increased.

The growing of leguminous crops is one of the best ways to increase humus, for in this way nitrogen also is added to the soil. Humus may also be increased by a more general and liberal use of stable manure, and by turning under stubble, weeds, or grass, instead of burning them. When these materials are burnt, nitrogen is lost as well as humus.

## METHODS OF PREPARING LEMONS FOR MARKET.

A preliminary study of the situation has developed the fact that lemons come on the market with widely differing histories.

Some are sufficiently colored when they are picked from the tree and are shipped to the market as quickly as possible. The so-called "tree-ripe" lemons are usually segregated and go on the market as inferior fruit, it being generally agreed that tree-ripe lemons do not have as good keeping qualities as the fruit which is picked green and colored artificially.

"Sweated fruit" is picked green when the proper diameter is reached, and colored rapidly by storage in moist, tight, sweat rooms or sweating tents in which a high temperature is maintained, usually by means of oil stoves burning in the room with the lemons or in a cellar-like room below the fruit and separated from the storage room by slatted floors. The humidity and heat, and perhaps carbon dioxid and other gaseous products of combustion, acting together bring about a rapid coloration of the fruit. Sweating is usually resorted to only when the price of lemons is high and a rapid marketing of the crop is desired. It is generally agreed among lemon growers that sweated lemons are less likely to keep than those colored more gradually at lower temperatures. Since the conditions maintained in sweat rooms are highly unnatural and the result is obtained in a most unnatural way, some attention has been given to the physiological factors involved in sweating.

By far the larger part of the lemon crop is picked when the desired diameter of the fruit is reached, and this is colored up by "curing" at low temperatures in the packing houses.

When writing advertisers, mention Cultivator.

In some places where the water loss from the fruit is likely to be relatively easy to control, an open floor covered by a roof is sufficient for a permanent storage structure. In order to enable the manager to modify conditions to suit the needs of the individual lots, the lemons, in boxes or trays, are piled up in carload lots, and each pile is covered by a heavy canvas tent, of which the sides and ends may be raised or lowered at will. In those regions where water loss is less readily controlled, the storing house is boarded up with the usual walls and ends. To secure uniformity of conditions with even greater ease, some growers have made use of cellars under the houses. Lemons colored by this slow "curing" process may remain in the tents or cellars as long as six months or more if market conditions require it, but usually fruit is marketed much sooner.

In grading and packing the fruit for market some lemon houses handle the sweated and tent-cured sorts separately, but this is not the invariable rule.—Circular 26, U. S. Dept. Agr.

## VALUE OF THE LABEL.

One of the greatest assets of the Florida citrus fruit grower will be the label on all boxes packed by exchange packeries. It means the standard of excellence for the Florida-grown product, and the day is not many weeks off when the demand for Florida oranges and grapefruit will be confined to fruit bearing this guarantee of good faith and the square deal.

It stands for quality of fruit, first of all; for careful selection, grading and honest classification; for careful handling from the trees and through every process of preparing for market in order that it may preserve its many virtues for the greatest length of time. It will mean that the superior quality and unequaled flavor of the "ripe orange on the tree" will be obtained by the consumer, who long ago pronounced it the finest fruit on earth.

It has behind it the guarantee of a state organization, the strongest and most reputable ever formed in Florida, whose continued success and prestige depend on pledges fulfilled.

Hundreds of enthusiastic salesmen, knowing what the California exchange has accomplished and having equal faith in the Florida exchange are telling the buyers over thirty states what the label means and what to expect "when the box is opened."

Millions of appetites are being whetted by this advance work and when the Florida orange and grapefruit are at their best they will go to a hearty welcome from those who have so often been stung by the debased product shipped under all sorts of false conditions.

It means added price on every box that bears the label.

It means a premium for the grower, and not for "the man between," for he cannot use it.

The reputation of Florida fruit will be fully restored through the exchange this season, and the label will be the sign whereby people may know when they get what they are paying for.—Jacksonville Times Union.

## DIRECTIONS FOR PLANTING TREES.

When received, the trees should be heeled in, the fine dirt being well worked in around the roots. If dry, they should be well watered.

In moving, they should be covered with wet burlap or something to protect them from sun and wind.

Holes should be dug four to six inches deeper than the tree goes down; this space filled with fine surface soil.

All bruised or broken roots cut off with a sharp knife, leaving a smooth, sound end cut from the lower side up.

Set the tree one and one-half to two inches deeper than it grew in the nursery. Set with a slight lean to the southwest, straighten the roots and work fine dirt under and between the roots, packing firmly.

When all the roots are covered, pack the whole firmly with the feet, then finish with loose dirt.

Ed Brown was in the office of John Frederick, arranging to renew his fire insurance. Frederick was looking up the descriptions, valuations, etc.

"Let's see," he was saying, "any changes in the property described as follows, to wit:"—and so on? You've been doing some building, haven't you, Ed."

"Yes," Brown answered. "I've built a new barn, and put on some new roofs. I've got this Rex Flintkote Roofing on all my buildings now, including the house. No more shingles or tin or tar-and-gravel for *me.*"

"Good for you, Ed. Now, this Rex Flintkote Roofing is fire resisting, isn't it?"

"You bet it is. I made sure on that point. I sent for a free sample of Rex Flintkote Roofing, and tried it with live coals of fire. Then I tried it with water, too, — never feazed it. There's no getting-away from dead sure prove-up tests like these."

"You're right, Ed. I have to keep posted about different roofings. Fires nearly always start on the roof. In the cities, where they have strict building laws, people aren't allowed to use shingles and other inflammable materials for roofs. And there's just as much danger from flying sparks around farm buildings. Something might be wrong with the chimney on the house—threshing-machine engines are around shooting up sparks—a dozen-and-one ways a fire might start, if you havent got a proper roof.

"But—here's what'll tickle you, Ed. I will try to give you a lower rate of insurance, now that you've got Rex Flintkote Roofing on your building.

"Is that so! Well, Im going to tell every farmer in the country about it, and I guess they'll all be sending to Boston for that book which tells about Rex Flintkote Roofing. If anybody wants to know about it, Mr. Frederick, you tell them to write

## PRUNING MATURE TREES.

MANY and varied are the excuses offered by the man who owns an unpruned orchard; he is ashamed of the neglected trees and tries to justify himself by advancing what he considers, or more likely what he tries to persuade himself, is a good reason. One holds that pruning is little short or sacrilege, contrary to the laws of nature; another tells of his fond recollections of childhood and what excellent fruits he picked from the old apple tree, pruned alone by nature; another says it does not pay, and in his particular case it does not, for the chances are that the orchard is neglected otherwise. The only excuse that has any semblance of justification is that of ignorance, and that does not excuse the man who makes no attempt. Nature's object is the production of seed with provision for its distribution, and she is satisfied when a cherry is produced with enough flesh to attract some fruit-loving bird that may, perchance, drop the seed far from the parent tree. Man grows the fruit for its fleshy parts, and tries to improve these parts, as much by placing the plant in a more favorable environment, as by plant breeding and selection. The man who has the fond recollections of childhood would no doubt find them only childish fancies, as did the man who returned to his childhood home and tried coasting, he would be disappointed. The man who cannot afford to prune, cannot afford to grow fruit, and the man who does not know how to prune must learn; the principles are not complicated.

### Physiology of Pruning.

To be an intelligent pruner one must know something of plant physiology. He should know the effects produced by pruning at different seasons of the year, how to make a cut that will heal most readily, and the influence of pruning on the fruit bearing habit of the tree. It may be said that the fruit grower prunes at his leisure, but luckily this conforms pretty closely to the proper season, when looked at from a physiological point of view. It is generally conceded that pruning during the dormant season incites wood growth, while pruning during the growing season promotes fruitfulness; and, since our trees tend to overbear, it is logical for us to prune largely during the dormant season.

Although it is said that pruning during the summer season may encourage the formation of fruit buds on tardy bearing varieties, it may have the opposite effect, unless done at the proper time, and may cause late growth and unfruitfulness. To give the desired results one must summer-prune shortly before the season of growth ends; earlier pruning starts new growth, while late pruning gives no results. The benefit derived from summer pruning seems to depend upon the ability of the pruner to prune at a time to bring about early maturity. In an irrigated section where soil conditions are easily controlled, the same end may, no doubt, be more easily attained by proper manipulation of the irrigation water.

Both the season at which the wound is made and the character of the cut have an influence upon the healing process. The pruner should remember that all food material capable of healing a wound is taking a downward course through the inner bark and that, to heal well, a wound must be in a position to intercept the downward flow of sap from foliage higher up. When a limb is to be removed entirely, the cut should be at the union with, and parallel to the surface from which the limb arises. Where limbs are to be headed-back they should be cut to a side limb and not to a bare stub. Wounds naturally heal best when made at a season of the year when growth is most active, but, with the possible exception of wounds made in early winter and subjected to a long season of drying, the season at which the wound is made has not important bearing upon the healing process. The grower who has a small orchard that will permit of such a practice, should delay the pruning until as near the opening of the growing season as possible.

Fruits have two general types of fruit-bearing; from terminal fruit buds and from axillary fruit buds. The first type of fruit bud is well represented in the apple and pear, and the latter in the stone fruits. Trees which produce axillary fruit buds are naturally more prolific and require severe pruning as a means of thinning the fruit. In fact, a system of pruning under which the tree with axillary fruit buds would thrive, would cause the apple tree to overgrow to such an extent that it would be rendered almost barren. The point may be more fully illustrated by comparing the peach and the cherry. Although both develop axillary fruit buds they differ in their fruiting habits; the fruit buds of the cherry are seldom found on the stronger growing new wood, and severe pruning, as practiced on the peach, would throw much of the strength of the tree into the production of strong wood that would carry very few fruit buds. We have said that in the apple the type of fruit-bearing is from terminal buds, yet, many varieties develop axillary buds. Varieties which develop axillary fruit buds and bear terminal fruit buds on young spurs all tend to overbear, and require severe pruning. So to a certain extent one can decide for himself how much to prune by observing how the tree bears its fruit.—O. B. Whipple of Colorado Ag. Col. In Bul. 139.

---

## EXPERIMENTS IN APPLE CULTURE.

By H. G. Keesling, San Jose.

Aside from my other fruit work I am interested in a small way in apples. During the past twelve years I have planted something over fifty varieties including the old established sorts common in this section, the Newtown Pippin, Winter Pearmain, Yellow Belleflower, Jonathan, Red June, Gravenstein, Fall Pippin, etc.

Among the sorts not common here the Stayman, Winesap, Mammoth, Black Twig, Winterstein, Delicious, Extra Ben Davis, and Missouri Pippin have proven to be worth while and I shall plant more of them. Some other varieties and among them trees and scions of new varieties that have been sent me for trial will have further time to prove their merits.

Among those already grafted over as not worth raising are Red Harvest, Early Melon, Sure Crop, and Red Beitigheimer.

Hubbardston, Glowing Coal and Nonpareil bought of the same nursery are one and the same variety and not worth raising.

From the descriptions of these varieties in the Nomenclature of the Apple I am compelled to doubt if either name is correct for the trees that I have.

Grimes Golden does not come up to expectations being under size and only medium in quality. Apple of Commerce, Senator, Champion, Ingram and some others do not show good results and may have another chance to make good.

Mr. Keesling further adds regarding the fruit situation for the past season: "The fruit growers of this section are feeling much more cheerful than for two years past. While the prune prices are rather low, still the demand has been good and more money has passed into the growers' hands than for two years past.

My experience this year has been: cherries a good crop and fair returns from eastern shipments; apricots not a full crop, prices fairly good; peaches half a crop and price low; prunes a fair crop and sold on two and a quarter base."

More Money For You

Greater productiveness of trees—larger, cleaner, and finer fruit—more money. Isn't that fruit growers' reasoning? Nothing will contribute to this end more than effective spraying. And **Effective Spraying** can best be attained with

Bean Magic Spray Pumps

Effective spraying means **High Pressure Spraying** and till the advent of the Bean Magics a high pressure could not be maintained with a hand pump for any length of time, on account of the body-racking effort needed to operate it. The Bean patent spring divides the work between the two strokes of the handle and works against only one-half the pressure shown on the gauge and saves exactly one-third the labor.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

### PRUNING TOOLS.

Every pruner should be furnished with good tools; good tools encourage him to do good work. This does not necessarily mean that he must have every tool on the market, many of them are useless; it does mean, however, that the axe and a dull saw have no place in the catalogue of pruning tools. The pruner needs a good saw, a good pair of light shears, a pair of heavy shears, possibly a good heavy knife and, of course, a good ladder. Two common types of saws are found on the market. The common saw with teeth on both edges is a good, cheap one and will answer the purpose in many cases. The various makes of the swivel saws are much handier, however. The blade is stretched between swivels and can be turned to any angle with reference to the frame. It is well adapted to close work in the crotches of the tree. This type of saw can generally be bought for three dollars. The blades are not so frail as they look and seldom break, if properly handled; they can be replaced at a cost of fifty cents. It is really the best type of pruning saw and should be more universally used.

A good type of hand shears is indispensable for light work. Various makes are on the market; buy the one that appeals to you. A pair of heavy shears is almost as essential; they take the place of the saw in many cases and will do the work in less time. They are used in heading in limbs where the saw can hardly be used; the peach pruner finds good use for them. They work well on limbs up to one and one-half inches in diameter. The only objection the writer has to this tool is that the pruner sometimes gets careless and leaves stubs. There is a type of heavy shears on the market that has two cutting edges instead of one, but it seems to do no better work. The pruner finds very little use for a knife in pruning mature trees and seldom carries a special pruning knife. Several types of the long-handled tree-pruners are on the market, but they are of little value in the orchard. The pruner should be close to his work, and with a good ladder and short-handled tools he will do better work—Colorado Ag. Col. Bul. 139.

### STATE FRUIT GROWERS.

The fruit growers of Watsonville are making ready for a big State Convention. We note the following in the Pajaronian:

The Pajaro Valley Orchardists' Association met this afternon in the rooms of the Board of Trade and was presided over by President C. H. Rodgers. The purpose of the meeting was to discuss ways and means for the local entertainment of the delegates to the State Fruit Growers' convention which meets here in December. This event will be one of the most important of its kind ever held in this city and President Rodgers has appointed some strong committees to arrange for the convention.

The committees appointed are as follows:

Reception—A. N. Judd, Otto D. Stoesser, C. O. Silliman, Edward White, R. W. Eaton.

Finance—W. H. Benteen, Hon. J. B. Holohan, I H. Tuttle, James Rowe, P. J. Thompson, J. D. Murphy, Charles Smith, C. G. Redman.

Automobile excursion—J. A. Linscott, James Sheehy, M. B. Tuttle, W. H. White, Peter Storm.

Rooms—E. A. Hall, G. A. Morehead, G. W. Gretter, R. G. Einfalt, C. H. Baker.

Entertainment—Mrs Otto Stoesser, Mrs. C. O. Silliman, Mrs. R. W. Eaton, Mrs. I. H. Tuttle, Mrs. C. H. Rodgers.

---

Tulare County Grange No. 198 P. of H., at its last regular meeting, passed strong resolutions advocating the retention of the Experiment grounds for agricultural purposes. Buildings for the station were erected by subscription from residents of Tulare, although the title was given to the University of California.

No separator has ever made the real, practical records that has

**The United States Cream Separator**

Try though they may it can't be done.

It has continuously held the **World's Record** on all practical points of efficiency since the Pan-American Exposition 1901.

The officials at the Seattle Exposition (this year) have still further honored the United States Separator awarding it

**The Grand Prize**

This is the highest honor that the Exposition could bestow. The U. S. was positively the only cream separator thus honored.

It is **cleanest skimming, practically no repairs** and **constant use** that makes the **U. S. Separator more valuable** than **any other.** The extra it earns soon repays its original cost.

Hard facts are better than theory; honest records are far better than fake claims.

We want you to see for yourself why the United States Separator was awarded the **Grand Prize.** Please go to our local agent nearest you. He will show you.

It's money in your pocket to know the U. S. Catalog No. 20 sent on receipt of a postal tells you all.

US VERMONT FARM MACHINE CO., Bellows Falls, Vermont. US
INCORPORATED. 1873

**Prompt Delivery Assured** California Customers from Stockton warehouse. No delays. Address all letters to Bellows Falls, Vt.

**Save from $1 to $2 per horse**

that you now pay for clipping by doing it with this splendid

**Stewart No. 1 Horse Clipping Machine**

New and improved *1908* Model Ball Bearing and all enclosed gears running in oil. The price at your dealers' all complete, is $8.50 ONLY

**Every Horse should be Clipped** Clipped horses look better, feel better, work better, and are easily cuffed. No machine ever made runs so easily, clips so fast, and lasts so long as this ***Stewart No. 1.*** It is fully guaranteed and must please or the purchase price will be cheerfully refunded.

**All leading dealers have it. Ask to see it!**

It is the greatest clipping machine of all time. If your dealer hasn't it, write to us about it.

**Chicago Flexible Shaft Co.** Dept. H, **Chicago**

**Pioneer ROOFING**

We tell you to put on a "Pioneer Roof," and forget it. Needs no paint or repairs. Sun proof and rain proof. Not affected by extremes of heat or cold. Suitable for all kinds of buildings—pitched or flat roofs. Comes in handy rolls. Easy to lay—anybody can do it—no special tools needed.

Now then—Let us send you samples, a copy of our 32-page Roofing Booklet and name of our nearest agent.

# Live Stock and Dairy

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

## COW TALKS.

**By Mrs. M. E. Sherman.**

THE temptation to keep too many cows for the amount of feed grown is often very great. The right way to act in these cases is to sell off some of the stock. Few of us have courage to do that, but struggle along making life harder for ourselves. I am often surprised at the excellence of the advice I can furnish others and wish I could bring myself to follow it. I am always hoping to skin through somehow with less feed that I like to have. As the animals must not suffer, it is often a loss to buy them feed. The silo is the greatest of aids and without mine I should not try to dairy very long. This month past the Danish Creamery of Fresno paid thirty-nine cents a pound for butter fat. This looks very large, yet compared to the days of $4.00 a ton alfalfa hay and twenty cent butter fat, I do not see that the net profits are much greater than in former years. Alfalfa hay is now $10.00 a ton and milkers' wages are ten dollars a month greater. I sometimes feel that we producers are handed the skin of the sucked orange every time.

**The Silo.**

The smallest silo I have ever read about is eight feet in diameter and twenty-four feet in deptb. I should not care to build one as small as this, for it is not hard to hold the silage from spoiling if a cover is used on it. I find silage keeps well for five days when undisturbed under the cover. In the twenty-six foot silo the cover is made by sewing sacks together leaving them doubled so as to make greater thickness. The covering is made in three pieces and is very convenient to handle. Each piece should be large enough to lap generously over the other one.

**Corn.**

We have not found it profitable to plant pumpkins with the corn, as on irrigated land the corn is easier handled if in rows instead of in hills. The land can be cultivated in the rows and the water run in a furrow between them. It is not easy to grow a corn crop if the land is flooded, for it bakes and checks the corn growth. Cultivation is the life of corn and it can hardly have too much shallow work done on it. The only thing to avoid is to not cut the roots too severely. The amount of corn grown by hills and by row system varies in actual tests only a few pounds. As it does not always vary in one direction, the advocates of either system cannot say their way is best. When corn is not in hills it makes too dense a shade to allow pumpkins to mature well between tbe rows. The easier way to proceed to make another crop come on rapidly is to sow either barley or peas between the rows at the last cultivation. These will remain dormant until the first rain and after the corn is cut. Tbe peas or grain will start to grow as soon as the weeds and make a good growth. I like this way of handling the land intended for soiling cattle, as it is little trouble to put a seeder on the cultivator when running it through the land.

**Time of Planting.**

Some of the corn was planted in April and then along until July as convenient, and it was all ready for the silo this past month as far as maturity was concerned. The difference was great in the amount produced to the acre. The early planted went twenty tons to the acre while the last planted produced about seven. The difference was in the length of its legs; the longest produced two and sometimes three ears to a stalk while the later planted was not often found with two ears. The seed was all grown the year before by the same person. Our seed corn is very poor, I have been looking over the sacks and I do not find a single ear that would score high in the entire lot. As the seed corn came two years ago from a celebrated breeder of corn, the conditions of culture and climate must be taken into consideration to account for this excessive sporting or reverting. The first year that corn is grown under irrigation it is never as good as it is later on. Corn is a seed that does best when not changed too often. In California it has been impossible to find any seed that was not greatly mixed in character. I have had to make a fresh start. It does not look encouraging to see the corn do so poorly at first. Next year I expect to have more perfect ears formed, as the corn will then be acclimated.

**Too Much.**

Whenever there is too much corn it may be made into fodder, but to be of value make it early. When the corn is let stand until it is dried up and woody, the stock will waste it badly. Corn is only a giant grass of great beauty. It should be treated as a grass when it is used in place of hay. Cut it and cure it green and there will be found to be almost no waste.

Here in the San Joaquin Valley corn silage balanced with alfalfa hay is our cheapest feed. The thinner land from which alfafa is cut for hay must be manured. Some of tbe heavier soils may go on producing for some years, but any crop taken away constantly from the land must take elements of plant growth with it. Alfalfa adds nitrogen to the soil by its roots and in that way enriches it after a time. Where a five year's rotation is in use and the land is planted on the fifth year to corn, the alfalfa sod is turned under in the winter months and the land given a thorough plowing and kept cultivated during the winter and spring and in April the corn is planted. Then some commercial fertilizer is drilled in at the last cultivation and the whole piece is planted to barley or wheat the next winter for hay. The next summer the land is used for sorghum or beets for the cattle, and after the crop is off, put on all the manure possible, and plowing it under, sow to peas and oats. There will be nearly a stand of grain from the manure so only ten pounds of oats to the acre need be sown. The next summer another Indian corn crop follows and then the land goes back to alfalfa once more after having had a liberal dressing of 500 pounds of gypsum to the acre. Every winter before the alfalfa is disked, it pays well to give the land some gypsum and alternate this with commercial fertilizer and barn yard manure, while gypsum may be applied in the spring the other fertilizers do best applied in the fall and winter to be washed into the soil by abundant rainfall.—M. E. Sherman.

## HARD MILKERS.

A cow or heifer with a nice, large, well developed udder with four good sized teats placed squarely upon same, seems like a source of pleasure, providing that they are easy milkers, but the same sort of a cow or heifer being termed a hard milker is as a rule a source of annoyance, especially to those who do the milking.

Owing to the fact that a cow or heifer is a nice easy milker they are usually milked out clean at each milking. In this way they are enabled to keep up their regular flow of milk, while on the other hand if tbey be hard milkers the milker becomes

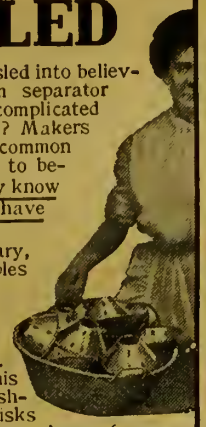
# MISLED

Have you been misled into believing a modern cream separator needs disks or other complicated parts inside the bowl? Makers and dealers selling common separators like you to believe so because they know their machines must have them.



The simple, sanitary, easy-to-clean Sharples Dairy Tubular has nothing in the bowl except the tiny piece here shown on the thumb. Compare washing this single piece with washing the pan full of disks here shown from a common separator. Yet Tubulars run easiest, skim fastest, and cleanest, wear longest—are The World's Best. Tubular sales exceed most, if not all, others combined. Tubulars probably replace more common separators every year than any other maker sells.

The world's biggest separator factory. Branch factories in Canada and Germany.

When writing advertisers, mention Cultivator.

discouraged and impatient, and fails to draw out the natural quantity. The cow or heifer will then soon show the effects of this by drying up on her milk. In this way many a valuable cow has become practically worthless as a milk producer.

Hard milking in cows or heifers can be positively overcome in a short period of time and in a very economical way (not by the use of the milking tube) but by the use of the teat plug.

The teat should be washed with an antiseptic solution, the teat plug should be dipped in a like solution, then in a little ointment and passed into the points of the teat; being self retaining it should be permitted to remain in the teat from one milking to another. In this manner hard milking can be made a thing of the past.

## BUTTER SCORING CONTEST.

A Dairy and Creamery meeting will be held at the University Farm, Davis, on November 23rd, in connection with the closing of the short course in creamery butter-making and the final scoring for the current year in the educational butter scoring contest. The sixth entry for the current year is due at Davis on November 20th and will be scored in time to announce the results of the first year's competition at the meeting on the 23rd. Some twenty California butter-makers have been competing during the past year for two prize cups to be awarded to those sending butter to the six contests, who obtained the highest and second highest average scores. Certificates of merit will be awarded to those obtaining an average score of 92 or above.

It is urged that as many butter-makers as possible accompany their entries to Davis. They will thus have an opportunity to observe the workings of the Dairy School and meet the students there at work. An opportunity will be given for them to note the quality of other butter entries and compare them with their own. The judges will discuss the entries at the meeting. In no way can a butter-maker do himself more immediate good, other than by taking a course, than by availing himself of this chance. Prominent California creamerymen and dairymen will be present and the important dairy questions will be discussed.—Herbert A. Hopper.

## INTERNATIONAL LIVE STOCK EXPOSITION.

With big crops, fat bank accounts and with prosperity reigning supreme in every country home, it is the duty of every farmer to look around for opportunities whereby his children can gain impressions that will prove beneficial to them through life and if by taking advantage of these, he can, at the same time, secure for himself and his good wife much needed rest and recreation, it would seem that such an opportunity should appeal to him. This opportunity is offered in connection with the International Live Stock Exposition which will be held in Chicago from November 27 to December 10. The champions of the leading shows of the world, in fact, the finest specimens of cattle, horses, sheep and swine that the world produces will here compete for supremacy and final honors. Do you know what this means? Can you realize what a liberal education such a collection produced by the world's foremost feeders and breeders means to your boys?

The best brains, the greatest masters of the live stock industry, the foremost live stock specialists will there demonstrate what can be accomplished, and shrewd farmers will begin to think of these things and endeavor to make arrangements so that they can profit by the teachings of this great International Exposition.

Four carloads of hogs were shipped from Ukiah by Mr. Garner last week, returning about $2000 to the farmers that brought them in.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

# THE NAMES STERLING DE LAVAL

The name DE LAVAL on a cream separator stands for much the same thing as the name STERLING on silverware. It means the highest standard of merit and quality in both cases.

There is the difference, however, that in the case of silverware the name STERLING signifies quality higher than many users can afford to pay for notwithstanding their desire to have it, so that they must be content with plated ware or some cheaper substitute; while in the case of cream separators the STERLING quality is within the reach of every buyer and costs no more than the plated or other inferior imitations, when actual capacity is taken into consideration.

There is likewise the all important difference that while the substitute for silver may answer the purpose almost as well as genuine STERLING, in the case of cream separators the imitation and substitute WASTE in quantity and quality of product every time they are used, and enough in one way or another to pay for the DE LAVAL yearly, while the DE LAVAL lasts for years after the imitation or substitute separator will have been worn out and cast aside.

Why then should any buyer of a cream separator be satisfied with anything less than STERLING quality?

Q.—WHAT IS A COW?

Ans.—A square critter with a peg at each corner to stand on. Built square so as to hold a lot of food.

THE COW TALKS: I have been called a milk machine. As a milk machine I can turn out milk and cream, but not on wiry, musty hay; green grass is best, but when you don't have that, give me sugar-beet-pulp, (Kow-Break-fast-Food) and get a good big milk check every month.

SUGAR-BEET-PULP only costs fifty cents per ton now. It will cost more later on, after it has gone into silo. You had better put some in silo yourself and if you write to the LOS ALAMITOS SUGAR COMPANY quick, that is before they stop grinding beets down there, you can have some shipped in carlots at a reduced price so that you can afford to put it in silo and have it for use after the factory closes down.

# Small Fruits and Vegetables

## THIS MONTH.

IT IS somewhat early, but strawberry plants may be set this month. Silverskin and Australian Brown onion sets may be planted, also crystal wax onions which are becoming a great favorite. This is the time to plant cabbage, celery, parsley, parsnips, turnips, salsify, beets, and rhubarb and horseradish roots.

Continue spading in of stable manure on ground to be planted next month or later. It is well worth while to have the soil friable and well enriched before planting. Besides that, if it is spaded up and manure well worked in, it will absorb more of the winter rains. If any rubbish is still left about the garden plot, it should be gathered and burned or composted away from the garden, because it may harbor insect and fungous troubles for the future.

## MAKING A HOTBED.

Does it pay one who wants, say, a few dozen tomato plants, a hundred or two each of cabbage, cauliflower, and lettuce plants, to make a hotbed?

If that is all you get out of it, and if you compute the cost in dollars and cents, it may be hard to find where there is any advantage in starting your own plants. At the usual market price in this vicinity, three dozen tomato plants would cost 75 cents, a hundred lettuce plants 75 cents, a hundred cabbage plants $1 a hundred, cauliflower plants, $1.50. It would cost about as much to produce these as to produce several times as much. The cost of seed, except for cauliflower, is a trifle. A 5 or 10 cent packet will give all the plants wanted. Cauliflower seed costs more. The most satisfactory early cauliflowers with me have been White Bouquet and Snowball. The seed cost 25 cents a packet. I've grown them side by side, buying seed from different places, and the only way I could tell them apart was because I knew where I had planted each.

I use for a hotbed sash that were here when I bought the place, three sash each 30x48 in. The ordinary sash are 3x6 feet. Hence my three sash do not give me quite the surface of two of regulation size. The time of making the bed has to be regulated by the season partly, and partly by opportunities to give it attention.

We keep one horse, and about the middle of February I get a bale of oat straw and use it for bedding, as it breaks up faster and gives about the right proportions of litter and manure. From this time until the hotbed is made the horse manure is kept separate, wheeled each morning to a convenient place near the hotbed. As it takes some weeks to accumulate as much material as is needed, I try to pile and pack the manure as taken out just enough to keep it from heating. Then about ten days before I want to use it I work it over, wetting a little if necessary, pile and pack down well, and let it heat. The first fermentation when it is handled this way takes about twice as long as when all fresh manure is used. In from four to eight days the pile will be steaming. Then I work over and make a new pile, taking care to mix well the fermenting matter from the interior and the dried material from near the outside, and to pack all firmly. In two or three days more this will be fermenting well all through, and ready to go into the hotbed.

Very early hotbeds are usually made with 2 to 2½ feet deep of manure, but I find about 1½ feet enough. For this depth the excavation need not be over 2 feet deep. This allows for about 6 inches of soil. For soil for the hotbed I like loam from a part of the garden that was heavily manured the year before, and free from weeds all season. The plants on such soil may not make quite as vigorous growth as where more manure is used, but I find them hard and thrifty and not so likely to be checked in growth when transplanted.

The convenience of the hotbed is to me one of its best recommendations. Your plants are right there when you want them. You take them right from the bed to the ground, and they hardly notice the change. Another great advantage is that you can get what you want. When I buy plants I often find it impossible to get the kind I want when I am ready for them, sometimes impossible to get them at all. As a rule you have to take one of the new kinds most popular in your vicinity. While these are mostly dependable, I like to experiment with attractive novelties.

After the hotbed is made and planted, the care of it is quite a chore—only a few minutes a day, but it continues through a number of weeks, when the weather may be extremely variable, the adjustment of the sash which seems best in the morning may not be suitable later in the day. Between my boy and myself, we manage that. He looks after them at noon and again in the evening if they need attention before I get back. In general I go on the principle that it is safer to have the bed a little cool than it is to run the risk of over-heating between morning and noon.—M. A.

---

A good inside paint where a gloss is not required, and one that will not rub off, can be made by mixing the dry color with sweet skim milk and applying as other paint. Ten cents' worth of dry color (some colors sell at but five cents a pound), with milk to thin, will cover as much surface as a dollars' worth of oil paint, and answers admirably where one is not justified in buying expensive paint, as is the case where one is renting by the year.

# Ornamental

### THIS MONTH.

BULBS which are not yet planted should be put into the ground as quickly as possible. Even early ripened gladiolus may be planted for spring blossoming. All Dutch bulbs should be in the ground. Amaryllis which bloomed early may be divided and given plenty of room in rich soil. Humboldt lilies, and other native bulbs growing in our mountains may be divided now and will be in good condition for the winter start. Any Watsonias which have not been planted should be at once before growth starts.

It is now in order to plant annual and perennial seeds. Those who wish beds of our state flower, the native poppy, may sow seeds in all waste places at this season.

Be careful not to let the ground get too dry. The days are short, and we sometimes think in looking out on the ground that it has enough moisture, but bear in mind that there have been no rains yet to reach into the lower depths, so that thorough watering should not be neglected.

Roses which were dried off earlier and have not started their growth, may be used for cuttings at this time, though it is possible that December will give somewhat better results. This is a good time to make cuttings of carnations.

Continue care of the lawn. If it has not been fertilized, give it a good application of bone or rock phosphate. If manure is applied, let it be well rotted to prevent growth of seeds of wild grasses as much as possible.

Plants that are not very hardy and liable to be caught by the early frosts may have water withheld to a certain extent so that they will not suffer great injury from cold, but let hardier plants have abundance of water until the soaking rains come.

Those in the "frostless" sections who have poinsettias, should keep them in mind from now on. Christmas time is when they are in their glory, and a little care on the cold nights will preserve this wonderful flower. Poinsettias are purely tropical plants and will not stand the frost, and a little protection will be appreciated by them.

### TRANSPLANTING WILD FLOWERS.

Wild plants may be moved even while they are in blossom, providing you are immensely generous in digging up the earth around them, and plenty of their own favorite mold remains around the roots.

To make the spot in the home garden as nearly like their own native home as possible, take up about 18 inches of soil from the bed where you propose to establish them. Lay at the bottom of this a 2-inch deposit of clay or spread broken shells and ashes to that depth.

On top of this spread the richest soil you can find. Mix it with rotten leaves and anything of that nature. Use very old manure if you cannot get old leaf mold. Fill in enough of this stuff to make the layer about 12 inches deep. This will leave about 4 inches to fill in. Get the black, spongy, rotten leaf mold from the woods or buy it from the florists who always have such mold on hand. To be perfect it should be coal black, as if it had been burned, and it should feel elastic and yet crumble away readily under the fingers.

A few stones buried just under this surface and a few others scattered around on top will aid in imitating natural conditions and retaining moisture.

If you are lucky enough to have a soil that is naturally very rich and black, it may not be necessary to do more than to add several inches of leaf mold and put in plenty of stones. Let falling leaves accumulate here and there on such a bed throughout the year.

Shrubs that have done blooming should be pruned at once. This induces blooming buds and branches for next year's crop.

# $1000 to $1500 Profit per Acre

Can be made on Crimson Winter Rhubarb. It is one of California's most profitable products. We make this statement after actual tests. We have made a study of the production of

## Crimson Winter Rhubarb

and find it easier to grow and less care and labor than corn or pumpkins. Plant an acre and reap an annual harvest of $1000 to $1500 or plant several acres and become wealthy in a few years.

J. B. Wagner

Better than a gold or any other mine.

Three Varieties of Rhubarb

# Eucalyptus Trees for Fall Planting

It has been demonstrated in the San Joaquin Valley that the best time to plant Eucalyptus trees is about the first of November, or as soon as the rains have thoroughly soaked the soil.

We have 200,000 trees of various varieties just the proper size for fall planting. We would advise that you place your order early, as there are very few trees to be had at this time of the year.

## Nature Study

ANOTHER most helpful little book for teachers who wish to give their pupils clear ideas regarding plant growth, soil conditions, and other elementary facts regarding agriculture, has been issued by Prof. Riley O. Johnson at the head of the department of biology and nature study of the State Normal School at Chico. In this book the writer gives in connected form a suggestive series of experiments in elementary agriculture. Prof. Johnson makes no claim to originality in this book other than the bringing together in a most attractive and instructive way of material which should prove very helpful. The needs of plants for air, warmth, light, carbon, nitrogen, sulphur, and the preparation of these materials is given at some length. The method of supplying these needs takes up the greater part of the book. It closes with an excellent list of books recommended for more extensive studies along the same lines. Prof. Johnson's book should have wide circulation.

## Seek Help.

WHEN WE REALIZE the great advantage which the work of G. Harold Powell and his corps of workers has given to the citrus industry of the state, and we believe is now giving to the Tokay grape growers, we do not see why a suggestion to the peach growers may not be in order along the same line. There are points on methods of picking, packing, and shipping which these close observers could give that would mean thousands of dollars to our shipping interests.

It is possible the peach growers are waiting for the Department to see the need and come to the rescue. No doubt that would be done in due time, but if we remember rightly, the orange growers of Riverside did not wait for the Department to see their need, but so emphatically impressed it on the attention of Secretary Wilson that the help was soon furnished.

If you don't see what you want ask for it.

## Producer vs. Politician.

WE RECENTLY SAW in an eastern paper the statement, "There is nothing that so much stunts the growth of a man as a piece of political pie." We never heard the fact stated in exactly these words before, but its general truth is apparent to all who have observed the ways of the ordinary politician. It is astonishing that many a man, upright in his calling and respected among his neighbors, once having accepted political appointment, forsakes his former standards and adopts those of the ward politician. Why a man's moral growth is stunted by partaking of political pie is subject to various answers, but this is a discussion not of causes, but of effects as shown in the horticultural commissioner situation in this state.

Two counties in particular in the southern part have had experience along this line which does not tend to give the growers assurance that their interests will be cared for by the politicians; rather it indicates that the politicians are using this great industry to replenish the political pie counter.

We mentioned last week the efforts of the growers of Los Angeles County to secure relief from political domination, and now Orange county faces a similar situation. Applicants for the position in Orange county failed to pass the examinations with the exception of one candidate. Under the law, the board of supervisors should have appointed that one. He is said to be thoroughly competent, but he is not the particular individual whom the supervisors feel should be appointed to keep the machinery of organization in proper trim.

## Still Organizing.

STATE HORTICULTURAL COMMISSIONER Jeffrey writes us that a meeting along the line of the two already held in Placer County will be held in Vacaville. Especial attention will be given to the question of the appointment of a county horticultural commissioner which will enable the growers to produce better fruit. At the same time the Placer county plan of standardizing the fruits will be considered.

## Institutes.

J. B. NEFF, conductor of Farmers' Institutes for Southern California, announces institutes as follows: At Templeton, San Luis Obispo county, Nov. 18, forenoon and afternoon sessions, with a barbecue at noon. Lompoc, evening session Nov. 19, with forenoon and afternoon sessions on Nov. 20. Topics discussed, apples and peaches, dairies and cream handling and care in shipping.

## Clubbing List.

THE SUBSCRIPTION DEPARTMENT wishes to announce the early appearance of its annual magazine clubbing price list. Owing to lack of space, it is impossible to print it in this issue, or possibly the next, but it will be in the paper at the earliest possible moment.

In the mean time copies of the list will be mailed to any upon request. Just drop us a postal and it will be sent you by return mail.

The list this year is very attractive both in prices and quality of magazine listed. It offers a way to receive the best of reading matter with the Cultivator, at greatly reduced rate, and we wish to recommend it to all readers. It is our aim to make this an added attractive feature of the Cultivator and we do not doubt that it will be appreciated.

## National Apple Show.

THE NATIONAL APPLE SHOW opens its doors at Spokane, Washington, next Monday morning, and it is expected that the $25,000 premium list will bring together a wonderful showing of apples. The sweepstakes class carries a $1500 cash premium in the carload class, which will give the title of "Apple King of America" to the section winning it.

The Lafean apple packing and grading bill now before the United States Congress, will be discussed, and efforts made to prevent its passage.

## Control of Tuberculosis of Cattle.

(Continued from Page 459.)

It is interesting to note that tuberculin tests of these reacting animals repeated after an interval of three months showed that fully 25 per cent failed to react. Here is evidence of oscillation between an active and an arrested condition of the disease as indicated by the tuberculin test.

We cannot depend upon the tuberculin test to indicate the absence of tuberculosis in an animal. The fact has important bearing upon the matter of the purchase of animals subject to the tuberculin test with the idea of putting them in a clean herd.

In practice, by purchasing animals from infected herds we are bound to pick up cases of non-reacting, arrested cases of tuberculosis. These are temporarily harmless, but we must keep a vigilant guard to prevent their infecting the herd after they have further succumbed to the inroads of the disease. The only way to do this is to apply the tuberculin test to the herd every six months in any herd supposed to be free from the disease. It would be far better to purchase animals only from herds entirely free from the disease.

As a guide in locating such herds it would be well to bear in mind that there is much less probability of finding tuberculosis in a very small herd or in one which has been very thoroughly isolated from other herds. Animals from very large dairies are always to be suspected, for the very size of the herd increases the chance that infected individuals have been introduced. In one herd of 450 cows, my associate, Dr. C. M. Haring, tested fifty of the best looking cows with the result that 83 per cent of them reacted. Some years ago I had occasion to test 71 animals which were scattered about a town in groups of five or less. Of these only eight per cent reacted. Wherever extensive tuberculin testing has been carried on, the conclusion has always been reached that the larger the herd, the larger the percentage of tuberculosis, provided the disease is prevalent in the community.

Moore gives some interesting figures bearing on this subject of the purchase of animals subject to the passing of the tuberculin test. Ninety-two cows were purchased on the test in a district where the disease was prevalent. They were kept by themselves and tested every six months afterwards.

| Date | No. Tested | No. Reacted | No. Not Reacting | Per Cent Reacting |
|---|---|---|---|---|
| 1907 Jan. | ---92 | 0 | 92 | 0. |
| 1907 Aug. | ---92 | 3 | 89 | 3.3 |
| 1908 Jan. | ---89 | 24 | 65 | 26.9 |
| 1908 Aug. | ---65 | 4 | 61 | 6.2 |

Moore gives other instances showing the value of purchasing cows by the test from a tuberculosis free herd as compared with the results of cows from infected herds.

Tuberculosis can be kept in check in dairies by the testing of every animal purchased and by testing the whole herd every six months. This is being done in the certified herds in the San Francisco Bay region. It is not uncommon though to have the percentage of reacting animals go as high as seven. Any relaxation of viligance as manifested by the semi-annual testing would speedily result in the serious reinfection of the herd. The reactors must be detected early and removed before they become centers of infection.

It seems safe to conclude that there is little chance of success in separating a herd of tuberculous and non-tuberculous animals by means of the tuberculin test, especially if the herd is badly infected. The Bang method offers in such a case the only practicable method of getting out of the trouble. This, in the present form as stated by Bang, consists practically in starting a young herd of young stock fed on the heated milk of the diseased herd. The new establishment must be quite isolated from the old one. The method has a particular advantage in that it does not demand the slaughter of animals that have merely reacted to the test and which may be only slightly diseased.

# Agricultural News Notes of the Pacific Coast

## Northern California

One firm at Napa this year shipped 65 tons of hops to New York by water.

Several new buildings are being constructed on the University farm at Davis.

The orange crop of Northern California is estimated at 450 cars this season.

Sonoma county hops have been awarded a gold medal at the Seattle Exposition.

The first shipment from the northern citrus belt was made from Oroville, October 20th.

It is estimated that Fair Oaks, Sacramento county, will ship nearly 100 cars of oranges.

The Nelson ranch near Marysville, Yuba county, will soon be sub-divided and sold to colonizers.

The newly organized Placer County Farmers Union held its second session at Auburn last week.

The increase in the price of hops is claimed to add a million dollars to the wealth of Wheatland, Yuba county.

Mormon Basin, Colusa county, bean growers, are threshing their beans by piling over sheets of canvas and rolling them out.

Celery growers near Antioch, Contra Costa county, report this the banner year in the history of celery growing of that section.

Paradise, Butte county, claims the largest apple tree in the state. It is asserted that one year it bore forty boxes of Greenings which sold for two dollars a box.

A serious problem confronting the farmers of the Imperial county is the rapid spread of Bermuda grass which is proving one of the most destructive pests of that section.

A big reclamation scheme is under way by which 52,000 acres along the Sacramento and Feather rivers will be brought under cultivation. It will cost about six millions of dollars.

The executive committee of the Anti-Debris Association has information that hydraulic mines that have been closed for years are planning to reopen.

Reports of county horticultural commissioners filed with the state horticultural commissioner show the season to have been a most successful one, with few new pests to report.

A project is under way to utilize the waters of Cowhead Lake near Fort Bidwell, Modoc county, to irrigate sagebrush lands in Southern Surprise Valley. It is thought the scheme may bring 60,000 acres of land under irrigation.

F A. Meacham of Santa Rosa has received 25 head of prize sheep recently purchased for the improvement of his herd. He is justly proud, as some of them are grand prize winners in England and this country. The lot contains the eight largest rams owned by one person in the world. In the shipment are Rambouilets, Southdowns, American Dclaine, Hampshiredowns, and Shropshires.

## Central California

The farmers union held its annual state convention at Fresno this week.

O. C. Williams has been appointed deputy horticultural inspector for the Dinuba district.

Castroville is in with the latest suggestion for festivals and will hold a "Sauerkraut Fair" in the near future.

The Porterville Messenger says that the survey of citrus producing lands of that section shows nearly 5000 acres.

A firm at Hanford, Kings county, is making large shipments of pumpkin flour to Arizona and other southwestern points.

The Counties Committee of the California Promotion Committee will hold its twelfth semi-annual meeting at Visalia next Saturday.

H. C. Carr has purchased the Graham twenty acre orange orchard in the Sunnyside district, the purchase price being given at $30,000.

Watsonville fruit growers are making preparations for a big state fruit growers' convention which will be held in that city early in December.

The Tulare County Citrus Fruit Exchange will not rush their fruit to market this year, believing that the late November market will be satisfactory.

Pajaro Valley has already shipped over half of the estimated 3000 to 3500 cars of apples for the season. Every packing house in the valley is doing a rushing business.

Pomona Grange of Tulare county held a quarterly meeting at Visalia last week. There was a good attendance from the four local granges which constitute the Pomona.

The cold storage company which contemplates the erection of a plant to handle Pajaro Valley apples, is receiving subscriptions and getting in shape for early operation of the concern.

The packing houses of Porterville opened to receive oranges on November 1st. Some excitement was occasioned by the report that Japanese laborers would be employed, but an effort will be made to discourage such a step.

The raisin market has materially brightened and many sales have been made at two cents per pound, and it is now reported that the Consolidated paid two and a quarter. Many predict that the price will go to two and a half or higher.

A shipment of lemons to Porterville from Los Angeles was returned by commissioner Shultz, and this has stirred the anger of the shipper. The action of Mr. Shultz has been sustained, however, by the office of the state horticultural commission which reports live scale on the fruit.

W. E. Sprott, manager of the Tulare County Citrus Fruit Exchange, states that the story with regard to shortage of orange crop so far as the Porterville section is concerned, is much exaggerated. The normal production is in the neighborhood of 2500 cars, and this year's crop will reach that figure.

## Southern California

Coachella Valley is shipping quite extensively of egg plant.

Coachella Valley is sending a large amount of fresh figs to the Los Angeles market.

Orange County claims the production of $13,000,000 worth of agricultural products last year.

Huntington Beach reports that a much bigger acreage of sugar beets will be planted next year.

Ventura is already shipping largely of new crop walnuts having already forwarded fifteen carloads.

U. S. Grant has been made president of the company to promote the Worlds Fair to be held in San Diego in 1915.

Several apple packing houses have been constructed in the Oak Glen section near Redlands, San Bernardino county.

The Oxnard Courier reports the sale of 250,000 bags of beans up to November 5th, which breaks all previous records.

The California Development Co. is building a new cement drop in the main canal conducting the water from the Colorado River.

It is reported that the cabbage crop of Orange county will be less than half that of last year, or in other words not much over 150 cars.

The Claremont Pomological Club will hold its next meeting at the home of Miss Stratton north of Lordsburg, on Monday, November 22nd.

Imperial Valley cotton growers are greatly elated over their cotton experience this year. Over a bale to the acre is said to be the average.

The Chino Land & Water Co. has moved 3000 head of cattle from hill pastures to corrals near the factory where they will be fattened on beet pulp.

The bean growers of the four southern counties of Santa Barbara, Los Angeles, Orange and Ventura, are maintaining a co-operative marketing organization which has made much money for its members.

The sugar factory located at Chino, San Bernardino county, closed for the season on the morning of November 4th with a record during the campaign of 79,562 tons of beets which made a total of 22,277,360 pounds of sugar.

The Orange county board of supervisors are in a muddle over the appointment of a horticultural commissioner for that county. The examination held by the state board of examiners resulted in only one candidate passing, and as that candidate was not agreeable to the commissioners, the appointment has been held up.

The suits of the Anderson-Barngrover Co. against various walnut associations of Southern California. have finally been compromised by the payment by the growers of $10,000. It is claimed that this carries with it the settlement for $23,000, a judgment for which was formerly secured against the Fullerton association.

## The Coast

Owing to low price of potatoes, growers of spuds at Pullman, Washington, are storing.

Farmers of Olathe, Colorado, are demanding 800 cars for immediate shipment of potatoes.

A reservoir has just been constructed at Council, Idaho, which will reclaim a 4000 acre tract.

A Montrose, Colorado, apple grower has netted $500 an acre this year on his ten acre apple orchard.

Apple growers of eastern Washington, have adopted the slogan, "An apple a day keeps the doctor away."

A lodge of the Patrons of Husbandry has been organized amongst the students of the state college at Pullman, Wash.

Wenatchee Valley, Washington, fruit growers will make a large showing of apples at the National Apple Show at Spokane.

Farmers under the Cascade Canal, near Ellensburg, Washington, are planning an expenditure of $300,000 in improving their water system.

"Apple, Rex II, King of the World of Fruit," has issued his invitation to his second grand reception to be held at Spokane November 15th to 20th, 1909.

"The finest oranges ever grown in Yuma Valley," is the report of the Yuma Heights Fruit Co. They are already being shipped to eastern markets.

A tract of about 4000 acres in Latah county, Idaho, yielded four million pounds of peas this year for which the growers received three and a half cents.

Farmers around Pullman, Washington, will plant extensively of flax because of good prices received last year, the price ranging not far from $1.30 per bushel.

Colorado is generally thought of as a mining state, but the government reports show this year that only four surpassed it in the growing of oats and five in wheat production.

The sheep men of Arizona made a better showing of sheep at the state fair held at Phoenix last week than any year previous. In all there are ten breeds of sheep exhibited.

A sale of from thirty to forty thousand boxes of apples was made by the Horticultural Union of North Yakima. This is one of the largest apple deals ever made in the valley.

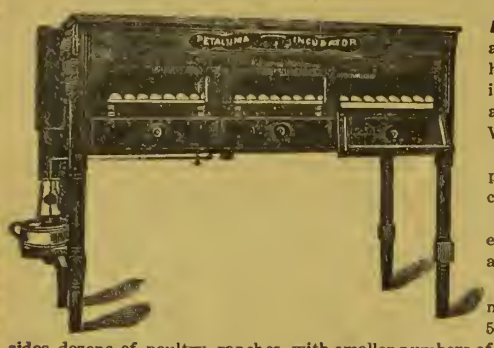
The Wenatchee Canal Co., which controls the canal conducting the water to its lands, a distance of over forty miles, will spend $75,000 in irrigation improvements before the next season opens.

An apple grower at Grand Junction, Colorado, has made affidavit that he harvested from one apple tree a ton and a half of apples which he sold for one hunred dollars. The tree is ouly twelve years old.

James J. Hill remarked in an address at the Dry Farming Congress at Billings, Montana, this week, that American farmers should be careful in holding back their wheat thus possibly favoring the wheat growers of the Argentine Republic.

# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

## Petaluma Incubator Company

**Petaluma, Cal.** **Indianapolis, Ind.**

Our General Agents for Incubators and Brooders and Midland Poultry Food:
**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

# STANDARD EGG FOOD

The kind that makes hens lay when other foods fail.

**90 Lb. Sack $2.35**

**Acme Roup Cure is Guaranteed. 50c Postpaid.**

## MRS. C. D. HUBBARD'S WHITE WYANDOTTES

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### FITTING BIRDS FOR THE SHOW ROOM.

By Mrs. Frank Metcalf.

TO have them in the very best condition for showing, the sexes should be kept separately, lest the hens plumage be soiled and marred.

A pullet that is just ready to drop her first egg is in the best show condition she ever will be, in most breeds, particularly so of the bright-colored ones.

It is well to handle the birds you wish to show daily, at the same time smoothing their plumage, which gives it a luster obtained in no other way.

If you don't wish to wash them, place in a coop containing a deep litter of clean straw, free as possible from dust, in which all their grain should be thrown. This will induce exercise, which brightens their combs, and cleans their plumage so that washing may be confined to the legs and feet, with a little grooming of earlobes and combs, which may be done with camphorated vaseline, a little of which may be rubbed well into the feet and legs after washing and drying, polishing carefully afterwards, lest it catch the dust.

Sunflower seeds and good whole corn is valuable at this time, and bread and milk is used by some. Fishel & Son, Hope, Ind., feed cooked rice three times a week with grains, stale bread and milk.

Old birds should be separated as to sex as soon as the breeding season is over, and well fed and attended to during the molt. Old and faded feathers must be removed by plucking, if not dropped before the show, as they cause a mottled appearance greatly to the birds' disadvantage. Plucking old, dead feathers, is not faking, but professional conditioning. Faking is "a bird of another color," and I do not intend to give any hints of how it is done, for it is the worst kind of "taboo" at present, and the fellow who gets caught at it is forever disgraced. And I hope every guilty one will be caught.

For shipping coops, use them large, light and strong, 30 inches is none too high for our large breeds, and do not put males and females in the same coop. Be sure to send only those that are uniform in color, shape, etc., and sponge the plumage nicely the last thing before you place them in the coop to ship.

If water is needed during their trip, place a cut apple or potato in the coop instead, as the water may be spilled and soil the plumage. Be very careful to get the dirt all out from under the scales on the shanks, using a toothpick, if necessary. Bright, clean, glossy shanks and feet attract attention and favorable comment, as do bright red combs and wattles. The camphorated oil or vaseline will give these a fine appearance that will last through the show, as a rule, although many use a wash of alcohol in preference.

Do not be discouraged if you do not win the blue the first time, but carefully inspect the winners and try to see wherein yours may be improved. Handle the birds at all times with great care lest feathers be lost or broken, for the judge must cut for each broken or missing feather, in wings and tails, unless he is over lenient and gives the specimen the benefit of the doubt. Study the Standard, and use your own judgement in selecting your specimens, but remember that you won't find any 100 point birds to show against, so do not fail to show good birds because of a few defects, which will only call for cuts in the section where found. Have confidence in your ability as a breeder and take the best possible pains to make the most of every showable bird you own, win what you can, with the determination to win more another time, for the show-room is an educator in more ways than one.—Mrs. Frank Metcalf.

### BANTAMS.

Bantams are the delight of children. But they are not simply ornamental. They occupy but little space, eat little feed, lay lots of little eggs and furnish a little roast, but they get there just the same when everything's counted with the big breeds, says one of their admirers. The little 22-ounce hens are used for hatching pheasant and quail eggs.

Breeding bantams is most interesting. There are active bantam clubs, and a large number of men are specialist breeders, as well as ladies and boys.

There are those called bantams that are simply dwarfs of large fowls. Such are the Black Rose Comb (miniature Hamburgs), the Games, Cochins, Brahmas, Polish, Malays, Silkies and Frizzles. But the Sebrights, Booted Whites and Japs are distinctly original and are in a class by themselves.

There are 25 varieties in American pygmy poultrydom, and the Sebright in gold and silver is most popular. John Sebright brought the first from India 100 years ago.

He succeeded in breeding them into a marvel of grace, beauty and sprightliness. Strange to relate, the male and female are laced exactly alike, and this lacing in all sections makes them a striking exception, and their low wings and wide-spreading tails increase their beauty. The only difference in Sebrights is that between gold and silver. Otherwise they are identical. The Golden Sebright is more common.

These attractive little birds have bright red rose combs, face and wattles, bay eyes, golden yellow feathers evenly laced with black, and undercolor, shanks and toes, dark slate; breast prominent; tail in both sexes the same and without sickles.

Standard weights—Cock, 26 ounces; cockerel, 22 ounces; hen, 22 ounces; pullet, 20 ounces.

Unlike diamonds, the smaller the bantam the more precious. A long season for development means large birds. Therefore hatch for shows in June and July, and August for regular breeders.

### LICE EAT EGGS.

Did you ever know that lice eat eggs? It's a fact. They eat them before they are made by sucking the bird's blood, and diverting the egg-making material from its proper channel.

If every producer of eggs in this country were to take absolute precaution against marketing a single bad egg, and would grade his eggs according to size, color and quality, before marketing, not only would his profits at once be considerably enhanced, but the growth in egg consumption would be so large and so rapid that much higher prices would prevail over and above the bonus for special quality. Think this over.

### LET FOWLS HELP THEMSELVES.

We have heard a great deal about balanced rations during the last few years, balanced rations for cows, for feeding cattle, sheep, hogs, human beings and poultry, until a good many people really believe that a great deal of feed is wasted unless it is properly balanced and contains due percentages of protein and carbohydrates.

Professor Haecker gave some of the theories about balanced rations for cows a sad knock by proving that it is not necessary to feed dairy cows so carefully, and Professor Davenport said to me one time that it was often good economy to waste a little cheap feed rather than buy a costly

one in order to make a balanced ration.

Mapes, of New York, announced that he was a heretic as far as feeding balanced rations to poultry, by telling how he gave his hens a mixture of all kinds of feed and let them select what they liked best.

While I have never tried to feed scientifically balanced rations to my poultry, I have roughly guessed at the proper feeds so the hen might have enough protein to produce eggs and carbohydrates enough to prevent the waste of protein, and have been very well satisfied with the results.—Poultry.

## NOTES OF THE POULTRY-YARD.

Change the pens of the ducks and sow the unused ground with rye or barley.

To fatten ducks do not allow them to have access to a swimming pool, as the exercise of swimming keeps them down.

Never sprinkle wood-ashes on the floor of the chicken house as it causes foot trouble. Use fine coal-ashes.

Just about now the surplus cockerels are beginning to eat their heads off. Sell them.

Plenty of fine dry dust in the roads now. Better lay in two or three barrels for winter use.

The often neglected youngsters should be supplied with plenty of shade during hot weather.

When feeding grain throw it broadcast all over the lot so that all the birds may have an equal chance.

Did you know that a turkey hen with a brood, if allowed her freedom, will seek a new roosting-place every night?

Turkey hens with poults do not thrive in closed board houses. Knock out the side boards and replace with wire netting.

Open turkey houses can be shut up during rain storms by leaning boards against the sides.—Ex.

## SOUTHERN CALIFORNIA SHOW.

The Poultry Breeders' Association of Southern California will give its annual show in Chutes Park, Los Angeles, Jan. 5-11. Judging will be by comparison, contrary to the former custom of this association. The members have heretofore preferred score card judging. It has been decided to do away with double entries, and all birds will be exhibited singly. A large showing of high class birds is expected. S. E. Salisbury of Monrovia is the Secretary.

An El Paso county ranchman finding a motor-horn in the road, took it home and determined to turn it to some wise use. So he taught his poultry to gather for meals at its toot, and all Nature may be said to have smiled until one morning a motor-car passing the farmyard blew a loud blast. The full strength of the poultry yard instantly ran out into the road, and began to pursue the car with all the ardor of railway travelers jumping off at Palmer Lake for lunch. At the end of the fifth mile fourteen pullets and three roosters succumbed through exhaustion. The others are still running.—Field and Farm.

## Bees

### KEEPING A SMALL COLONY.

OF ALL the sweets, none is more wholesome and delicious than honey. There is a scientific reason why it is more easily digested, and can often be eaten to advantage when other forms of sweets must be avoided. Chemically speaking, the nectar of flowers is largely cane sugar, but, in the ripening process, the changing of the nectar into honey, the bees use an acid secretion that changes most of the cane sugar into grape sugar, which change is identical with the first step of digestion in the human stomach when it starts out to digest cane sugar; hence, the body is saved that much labor. In reality, very little work is necessary in the digestion of honey—it is nearly ready for assimilation.

When bought in the comb there is no possibility of honey being other than absolutely pure, and, since the enactment of the pure food laws there is not much likelihood of liquid honey being adulterated, yet there is no reason why the majority of families might not find pleasure and profit in furnishing their own table with honey, by the keeping of a few bees; just as so many add to their incomes by the keeping of a few fowls. In fact, bees may be kept where it would be impossible to keep fowls for lack of room—up in the garret of a residence, they flying out and in under the raised sash of a window, or through openings cut in the walls. Men who are scientifically inclined ofter have an observatory hive of bees in their sitting-room or office.

The fear of stings probably deters thousands of people from enjoying the pleasures and profits of bee culture. Did they but know it, with sufficient care these stings can be entirely avoided; with only a little care, they can nearly all be prevented. The hands can be protected with rubber gloves, and the face and neck with a veil. Just a few words about the construction and adjustment of the latter. Get some open material like mosquito netting, or silk brussels net, and make a sack perhaps 15 or 18 inches in diameter and 20 inches in length. Into the hem at one end run a piece of rubber cord puckering up the end of veil until it will just nicely slip on over the crown of a hat, then tying together the end of the cord. Use a straw hat; slip the veil on over the hat; pull the lower end of the veil down around the neck, and tuck it inside the collar. When bees are gathering honey they are not inclined to sting, especially if a little smoke is used, but it is well for the beginner to protect himself until experience has inspired confidence.

Mention has been made of the use of smoke, and it may be added that, without the use of smoke, the handling of bees would be almost impossible. Smoke blown upon them terrifies them and sets them to filling their sacs with honey, when their inclination to sting is practically removed. Smoke can be obtained by igniting one end of a piece of rotten wood, or of a roll of cotton rags, and the smoke blown among the bees by means of the breath, but this plan is dangerous and unpleasant, and bee keepers use what is called a "bee smoker," consisting of a little tin stove, perhaps three inches in diameter, six or seven inches in height, furnished with a conical cover having an opening at the apex. Attached to one side of this little stove is a bellows with an opening near its lower end, opposite a similar opening in the stove. A fire of rotten wood or rags or some similar substance is made in the stove, when, by means of the bellows, the stream of smoke can be blown among the bees. It is an easy matter to drive a stream of smoke some two or three feet from the nozzle. When the fire is going nicely, a puff of smoke is driven into the entrance of the hive; then the cover carefully raised and a puff or two driven down among the bees, when any necessary work may be done with little danger of stings, provided the motions are slow and care-

fully made. If the bees show signs of any "obstreperousness," a puff or two of smoke will drive them back in dismay.

The location of an apiary, especially if it is to be near a dweling, is quite important. What is needed is a high board fence, or a hedge, or a screen of vines, or something of a similar nature, behind which to set the hives. In leaving for the fields or returning to their hives, the bees must rise above this obstruction, and this throws their "line of flight" above the heads of passersby. When the hives are kept in a garret, as already mentioned, the line of flight is, of course, far above the heads of people, and there is no trouble.

People thinking of taking up the keeping of bees are often interested in knowing if there is anything that they can plant in their garden that will yield honey for the bees. Of course, something might be done in this direction, but it would scarcely be a drop in the bucket compared to what the bees must have to be able to store any surplus. They fly far and wide, gathering nectar profitably miles from home. They visit the fruit bloom, white clover, the linden trees, if there are any in the vicinity; fields of buckwheat or of alsike clover, the golden rod and wild asters in the fall, and, even in a large city, seem to be able to pick up a living from the various plants that are in bloom. Men who engage in the business extensively usually seek some location that furnishes abundant bloom of the most desirable variety, but there are few localities in this country that would not profitably support a few colonies of bees.

One most important step is in getting the bees to make a start. As a rule it is better for the beginner to buy his bees of the nearest reliable beekeeper who has them to sell. Black bees in box hives can usually be bought much cheaper, but the work of transferring them to a movable comb hive and introducing an Italian queen is the work of an expert, and the novice might meet only disaster if he attempted this line of work. Bees can now be sent long distances safely by express, hence there is no excuse for taking up with a poor strain of bees in any old rattletrap of a hive. Get Italian bees in a good, movable comb hive of some standard pattern. When they come by express, set the hive down where it is expected to stand, light the smoker, and don the veil and gloves, all of which should be provided in readiness; blow a little smoke down through the wire cloth that covers the hive, then pry off with a screwdriver any block or stick that closes the entrance. Accompanying the outfit there will be a wooden cover for the hive. It may be fastened to the under side of the hive. Before opening the entrance it may be well to find this cover and detach it, and lay it over the top of the hive upon the wirecloth. After the bees are released leave them undisturbed for several hours, perhaps for a day or two until they have recovered a little from the effects of their journey and the confinement, when they will be in better humor. Use smoke when opening the hive again. With the screwdriver pry off the wirecloth. If the ends of the frames are nailed fast to the hive, pull out the nails with a hammer or some pincers, when, if you see fit, you can carefully lift out one or two of the frames of comb and gaze upon the wonders to be found inside a beehive.—Ideal Homes.

## 'TIS DISTANCE LENDS ENCHANTMENT.

An exact definition of a gentleman has been tried many times, never perhaps with entirely satisfactory results. Little Sadie had never heard of any of the various definitions, but she managed to throw a gleam of light on the subject, albeit one touched with unconscious cynicism. The word was in the spelling-lesson, and I said:

"Sadie, what is a gentleman?"

"Please, ma'am," she answered, "a gentleman's a man you don't know very well."—Woman's Home Companion for October.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Commercial Fertilizer with Cover Crops.

In fertilizing walnuts with commercial fertilizer where cover crop is used, what would be the maximum amount and what kind of fertilizer would you advise using in old orchard? Would you advise sowing fertilizer before cover crop seed, and with walnut trees is there any injury liable to result from irrigating about the middle of November?—A., Tustin.

If a good green manure crop has been grown in the walnut orchard for several years past, I do not think anything more than acid phosphate is needed. I am applying about 400 pounds per acre of acid phosphate running 17½ per cent available phosphoric acid on seventeen year old trees.

I sow the acid phosphate just before plowing under the green manure crop and want to do the plowing before any rain has fallen on the acid phosphate, so that when the water reaches the soluble phosphoric acid it will go down among the tree roots before it reverts, and not be in the soil that is turned back and forth by the plow and cultivator.

If your trees are carrying their foliage well there is no danger in irrigating and putting in the green manure crop at once. Neither is there any danger if the trees have matured their leaves and the leaves have fallen but recently.—N.

### Sowing Vetch.

Is it too late to sow vetch seed, and how should it be planted?—N., Los Angeles.

Vetch seed should be planted at once, first watering the ground thoroughly and cultivating to make good seed bed. Plant with drill, then harrow the ground well, and finally furrow as if for the irrigation. This will disturb some of the seeds. but sufficient will grow to make a stand. In the orchard 40 pounds of seed will be sufficient per acre; if broadcast, ten pounds more to the acre should be sown.

### Best Green Manure Crop.

What is the relative value of vetches and fenugreek for green manure crop for orange orchards?—N., Los Angeles.

Vetch has been giving the best results in the orchards. The tonnage (green) of about ten samples of vetch last spring, gave 23,385 pounds per acre, while fenugreek gave 7211 pounds per acre. The fenugreek gave a slightly larger perecentage of humus forming material, but when the difference in tonnage is considered, the vetch is much the better.

The vetch should be sown as soon as the ground can be irrigated, as if it gets a good start before the cool weather comes, it will continue to grow in the winter and be ready to plow under about March 1st. Forty pounds to the acre when all the ground is covered will be enough if it is properly put in.

### Replanting to Softshells.

I have a number of acres in hardshell walnuts, also some in softshell and alfalfa. I wish to remove the hardshells and sow alfalfa, ultimately planting to softshell trees. I am advised to plant alfalfa giving the roots of the hardshells time to rot out before planting the softshell. Is this good advice?—S., Los Angeles.

One year would not be sufficient time to allow the old roots to decay, or rather they would be more detrimental the second year than the first. If in taking out the old trees, you take out the old roots for a distance of six feet from the body of the old tree, you can plant at once. Plant nothing but grafted trees that are strongly resistant to blight and good producers. You cannot be sure of anything with seedlings, as some may be good and others worthless. You will find it advisable to plant not less than 60 feet apart, or you may plant two year old native black walnut trees in orchard form, then when they are large enough to graft at the height of six feet, have them grafted to the best producing, blight resisting walnut you can find. You will lose nothing in production, and will have trees that will not sunburn on the sides. You ought to get trees that have a record of producing not less than 150 pounds each at fifteen years.

**See "Cow Talks" in another column.**

### Time of Planting Walnuts.

What is the best time of the year to set out two year old black walnut trees?—J., San Francisco.

Your replanting can be done at any time after the leaves have fallen and before the buds begin to swell, but it is best to have the planting done early enough to have the rains thoroughly settle the ground around the roots of the young trees. It would be well to have the planting done in January, if possible to find the ground in condition to work on it, and not later than March in any event. If there should be no heavy rains after the planting, the trees should have enough water poured around them to settle the earth closely around the roots.

### Vetch for Seed.

I wish to try growing vetch seed, and ask if it is too late to plant. How much seed is necessary per acre, and what nurse crop would you advise? What soil is best adapted for such crop?—Subs., National City.

It is not too late to sow vetch seed now. The land should be watered and plowed, then well worked down and the vetch put in with a drill, using about 50 pounds of vetch and 40 pounds of wheat to the acre. If wheat rusts badly with you it might be best to sow oats as a crop to hold up the vetch, but wheat is the more readily separated from the vetch seed.

The soil best suited for vetch is sandy loam. It would be well to inoculate the vetch seed by taking some soil from a place where vetch grew well last year, pouring water over it, stirring it and then using the water to dampen the seed. The vetch will grow slowly when the weather is cool but will probably be ready to harvest by May 1st.

### Length of Tap Root.

I have purchased a bunch of grafted walnut trees and reliable party has told me that eighteen inch tap root is as good as one longer. I have had an idea that two feet or more would be valuable. It this the case?

I have also been told that if the holes are dug deep and then filled up to the point where the tap root should touch the soil, and loose dirt thrown about the roots, that it should not be tamped, that the rains and next summer's irrigation would settle the dirt sufficiently. I have always believed that the dirt should be thoroughly packed about the roots. What is your opinion?—Subscriber, San Francisco.

The length of tap roots on nursery walnut trees depends altogether on the kind of land on which they grew but I would like to have three foot tap roots if they are on the trees. The trees will do equally well with a short growth of tap root if they have plenty of laterals, but if the tap root is there, it should be left as long as three feet, and the laterals should be at least eighteen inches long.

There is no danger of getting the holes too large in diameter, but they are dug much below the bottom

of the tap root and filled loosely, without any packing, there is danger that when the water gets in and settles the soil, it will take the tree down until it will be planted too deep. If you can have the soil in a condition so that it will crumble, and then place it around the roots with the hand, spreading the roots well and packing as well as can be done by hand, you will be more likely to have the tree where you want it when the water gets around it. The hole should be filled to the top, except to leave a shallow basin to catch the rain if you depend on that, or to hold the water that you may pour around the trees. In any case, do not place the soil in the hole loosely and leave it, if the weather is at all drying.

### Fertilizer Proportions.

Kindly tell me how to mix fertilizer at home suitable for orange trees, in about the proportion of 3.65-7-3, using guano, nitrate, lime, superphosphate, sulphate of potash, and tankage.—M. F., Pomona.

With no compositions given I would assume the guano to contain 6 per cent nitrogen, 12 per cent phosphoric acid, nitrate of soda 15 per cent nitrogen, superphosphate 18 per cent available phosphoric acid, sulphate of of potasn 46 per cent potash and tankage 5 per cent. nitrogen and 20 per cent phosphoric acid. I would use no lime without a good specific reason. The acid phosphate and tankage will furnish plenty of calcium for plant food and it is a rare exception that we need the lime for its alkalinity. A 10-acre grove will probably need in one year about 1250 pounds of actual nitrogen, 2500 pounds of available phosphoric acid and 1100 pounds of potash. To obtain the nitrogen use 5000 pounds each of guano and tankage and 4667 pounds of nitrate of soda. By adding to these three ingredients 5000 pounds of superphosphate the 2500 pounds of phosphoric acid is obtained. Twenty-four hundred pounds of sulphate of potash will furnish the potash. This gives a total weight of 22,067 pounds containing 5.62 per cent nitrogen 11.33 per cent phosphoric acid and 4.94 per cent potash which is approximately in the ratio of 3.65-7-3. It is absurd to add sand or other inert material to lower the percentage. This mixture should be used in about four applications during the year or what is still better use these ingredients separately and not in the form of a complete fertilizer, but have the sum total at the end of the year to equal a complete fertilizer.—J. H. Norton.

### Birds Eat Peas.

What can I put on my growing pea vines to prevent birds from eating them up? They are about four inches high and the birds clean off every row—N. E. M., Santa Ana.

I know of nothing practical for small gardens except an "A" shaped frame made in convenient lengths—say 16 feet and covered with cheese cloth and placed over the rows until they grow large enough to be beyond the birds' power to destroy. The apex of the frame should be about 12 inches high. Three frames to a 16 foot length would be sufficiently strong. Nail narrow strips on these frames, made from one-half-inch battens ripped into two pieces. Three strips to a length will be enough—one at the top and one on each side at the bottom. With reasonable care these frames will last for years and many times repay their cost.—Q. A. L.

### Raisins for Stock.

Are the stems and cull raisins good feed for stock? What is the result of feeding them?—M. G., San Diego.

Raisins are an excellent fattening food for practically all stock, and when culls are not bringing a living price many growers have disposed of them in that way and made money.

### Celery Seed.

Please give time of sowing celery seed, length of time from sowing to maturity and the most popular variety.—W. W., Beaumont.

Celery seed is usually planted in March, April or May. It requires from three to four months from sowing of the seed until plants are large enough for field planting, time, of course, depending upon the season. Field planting is usually done about June or July and harvesting in the later fall months. We believe the most popular variety in Orange county is the White Plume.

### Goat Manure.

Is goat manure good for the garden?—C. A., San Diego.

It is practically the same as sheep manure which is selling in Los Angeles at almost two cents a pound. This is more than it is worth, but it is very valuable for the garden.

### Gypsum.

I note that you use gypsum in the stalls and on the manure after it is taken out. Will you please tell me the object of using it.

I have a lemon orchard in black loam soil inclined to run together and get solid after irrigating and plows up in chunks. I have been told to use gypsum to loosen it up, but can't find out the quantity necessary?—G. W. B., Santa Ana.

The use of the gypsum is to hold the nitrogen, one of the most valuable of the fertilizing elements of the manure. It also acts as a deodor-

## THE CITY MAN.

The city man said he was struck
  Upon the rural life,
No longer wished to run amuck
  In noise and dust and strife.

Said he: "I'd like to husk the eggs
  And dig the new-mown hay,
And monkey with the husking pegs
  And milk the cows for whey.

"I'd like to pick the cream and cheese
  And dig the apple crop,
And drive a team of pure white geese
  And feed the chickens slop.

"It would be fun to groom the pigs
  And curry off the cows,
And hitch the roosters into rigs
  And work the threshing plows.
'"Twould be a treat to shell the oats
  And pick the buckwheat flour,
And gather whiskers from the goats
  And sort them by the hour.

"I'd like to cultivate the bees
  And pump the pale blue milk,
And pick the pumpkins from the trees
  And do things of that ilk.

'I'd like to pick the little lambs
  And shear the gentle hens,
And gather in the fresh smoked hams
  And put the wasps in pens.

"In fact, I think the country life
  Would be the thing for me,
I do not care for work and strife,
  I need the rest you see."

—Green's Fruitgrower.

## ROOM NUMBER NINE.

ABOUT 10 years ago a crowd of jolly students had taken lodgings in Rue de l'Ancienne Comedie, an old house in the Latin quarter, with a narrow front, steep roof, very damp, and with dark gloomy stairs.

They were, nevertheless, gay and jolly there. In every story there were only two rooms, but also two singers, and even old Mme. Blanchard, the concierge, in her miserable mousehole of a room at the foot of the stairs, seemed to have been infected by the general gaiety, for she also sang most of the time.

The gaiety was suddenly interrupted, however. My friend, Coligny, who is now a professor at a provincial university, and who occupied room number 9, on the floor below me, grew morose, melancholy and worried about something.

One night I was about to go up to my room at 3 o'clock in the morning, without disturbing anybody, when I noticed a light in my friend's room, number 9. I felt a sudden desire to have a chat with him, and quickly opened the door. What I saw surprised me greatly. Coligny was sitting on his couch, far from his desk, his head resting in his hands, staring into space as if he had been hypnotized.

When I asked him what was the matter with him, he answered curtly that he was all right, shaking his head, as if to shake off some unpleasant vision.

I left him, thinking that he must either be in love or that his stomach must be out or order.

When we met again in the restaurant where we took our meals, I asked him to tell us what was the reason of his strange behavior, but he gave only evasive answers, and when we insisted he grew angry and said that we kept him from working. He soon became the same jolly fellow as before, so we forgot the matter.

Number 9 was empty for about a month, then it was taken by a delicate looking young girl. She was not very intelligent looking when she came, but after a few days she appeared to grow quite idiotic. She spent her days sobbing "Oh, Lord! Oh, Lord!" and during the nights I heard her sighing very loudly.

One night I met her on the stairs. She was in her nightdress, and cried: "Mme. Blanchard! Mme. Blanchard!" I asked her what she wanted, and if I could be of any assistance to her, but she simply stared at me and ran the three flights down to the concierge's room as fast as her legs could carry her. I heard her stammering something unintelligible, and at last the voice of the concierge saying: "All right, you silly thing, I will make a bed for you here in my room." Then the door was closed.

The next morning at 9 the young lodger at number 9 had paid, taken a cab and had fled to parts unknown. She, too! Was this room perhaps haunted?

I rushed to the room of my friend Coligny, and told him the whole story, but he looked more annoyed than interested.

His unwillingness to speak made me still more eager to find out something about the haunted room, so I decided to spend the next night there.

After having lit about a score of candles and placed them everywhere in the room, I went to bed, without undressing, about midnight, placing a revolver within easy reach of my right hand.

I can not say that I was absolutely calm, for the stillness, the expectation and the flickering of the many candles made me rather nervous. The illumination made me think of a wake and of ceremonies when "Dies Irae" is chanted, and in spite of myself I could think of nothing but ghosts, and all the uncanny stories I had ever heard came back to me.

About 2 o'clock there was a noise, at first rather vague, but it grew more distinct—three hard blows on the floor, followed by a fourth and fifth that was longer than the others. "Bang —bang—bang—bang—ba-ang!" It sounded, indeed, as if a lame person was dancing a clog dance, slowly and awkwardly.

I opened one of the closets in the wall and it seemed that the noise grew more distinct and came nearer. I was undoubtedly on the right track, but sudenly the noise ceased. This was a great disappointment to me, but I could reason. Evidently the wall on the left served as a music box, the sound came from it and it was merely an acoustic phenomenon which made it appear to come from the center of the room.

I went into the closet, closed the door and glued my ear to the wall and held back my breath. I heard now vague sounds on the other side of the wall a little above my head. Suddenly I was overjoyed to hear the knocking begin again and more distinct than ever.

What could possibly be going on behind this ventriloquistic wall?

The next day I told the story of my nightly experience in the office where I was employed, and when I had finished one of the men who had once been employed in the mint said to me: 'Why, that noise must sound just like the machine we had stamping coins."

This was an idea. The following night a police inspector with whom I had had a talk arrested in the next house a young man who spent his nights in coining counterfeit two-franc pieces and who had put his stamping machine in a closet adjoining that in our house.—Spokesman Review.

## WASH WATER.

Washing is a chemical operation, every part of which is dependent on water. Water does the washing and its purity is therefore of greatest importance.

One grain of carbonate of lime or other hardening salts in one gallon of water constitutes one degree of hardness. Forty-eight gallons of water of ten degrees hardness contains one ounce of mineral impurities and it will take 11½ ounces of pure soap to take out the hardness. In other words, that much soap is wasted because it takes every bit of it to soften the water instead of doing any washing.

Water containing more than five de-

Oakland, Cal.

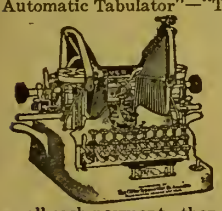
A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



Yours for 17 Cents a Day!

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

A Quarter of a Million People are Making Money With

The OLIVER Typewriter

The Standard Visible Writer

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

"An Oliver Typewriter in Every Home!"

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

941 Market Street, . . . San Francisco

grees of hardness should be softened chemically and the sediment removed before it is fit to wash with. Some water contains over twenty degrees of hardness.

The practice of breaking hard water in the tub or boiler with soap is expensive and slovenly. The coagulated hard water sediment is still left in the water and make the clothes look gray and feel grimy. That part of the soap taken up by the hardness is killed. Then and not until then, what is left of the soap begins to wash.

Any process of breaking or softening water which does not remove the sediment of impurities makes nice washing impossible. The coagulated impurities must go somewhere. If not removed from the water before the washing is put in this sediment settles on the boiler, tub, or in the clothes.

The compound for softening water is three parts powdered borax to one part powdered alum thoroughly mixed. In warm water dissolve four ounces of this compound for every ten gallons of water to be softened. Pour the solution into the water, stir briskly. Coagulation begins at once and in a few hours all impurities will settle in the bottom. Then the pure, soft water can be drawn off and used in the laundry.

For convenience in arranging for a constant supply of soft water for household use have the barrels mounted high enough to get a pail under the faucet. Put a faucet about six inches above inside bottom and another faucet or plug in lowest possible part to remove sediment. Purify the barrel of water and when it has settled draw off the soft water through the upper faucet. This leaves the sediment undisturbed in the bottom. With two barrels one can be used from while the other is settling.

Water of ten degrees hardness can be softened and purified at a cost of about 50 cents a thousand gallons. It is cheaper to use too much powder than too little.

Water test. Dissolve some good soap in alcohol. Drop it in a glass of water and if it turns milky the water is hard. If clear the water is soft.—Successful Farming.

### A SIMPLE FIRELESS COOKER.

Procure a large candy pail with a tight cover. Pack excelsior or hay three inches deep in the bottom, then set the kettle or pail you wish to use, which should be straight sided, and leave a space of at least two inches all around the sides, into the center and pack tightly all around with the same material as the bottom. If you have two pails that will "nest" nicely, leave the one in permanently, and proceed to pack the lid with a similar padding of the excelsior or hay, taking on a cloth to hold it in place, said packing to be on the under side and to fit closely over the lid of the cooking untensil. Now boil whatever feed you want to cook for about five minutes, and quickly place in your nest and cover first with a tight tin or enamel lid, then with the cover you have padded, and leave it severely alone until you are ready for it. Lifting the lid to see how it is getting along, allows the heat to escape, and stops the cooking. Of course, this is a small arrangement and will not accommodate much over a two quart kettle, so if you have a larger flock than this will suffice for, you must use a larger "cooker."—Mrs. Metcalf.

A man tried to speak, and he spoke:
"I'd treasure to seek, and I soke;
The bold robbers crept.
And robbed as I slept—
I'd vengeance to wreak, and I wroke.
"They wanted to steal, and they stole;
One thought he should squeal, so he squole
He told me the facts
Concerning their acts—
What he could reveal he revole.

"I dared them to fight, and they fought;
My dog tried to bite, and it bought;
It ran them away—
This tale of the fray
I wanted to write, so I wrought,
—Chicago Evening Post.

Heald's BUSINESS COLLEGE

is the undisputed leader of Business Education on the Pacific Coast, and has been for the past forty-six years, having graduated over thirty-five thousand students.

| Light Amber | 10@12 |
| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week just past have been 2625 tons; more than one-half of this amount has arrived by water. Railroad arrivals have been very light, and we believe will continue so for a week or two at least.

Market prices have remained about the same as they were for the ten days preceding this week, with the exception that choice wheat hay has been in a little better supply, and the prices on this grade have weakened a little on this account. The demand for all grades of hay for the past ten days has been decidedly light.

All the main shipping points have been complaining of lack of cars. The receipts for this market for the past ten days would have been much heavier had cars been furnished the shippers.

We present below a comparative statement of the amount of hay on hand available for the San Francisco market, as compiled by the San Francisco Hay Association from recognized authorities throughout the state, to show how the amount of hay on hand this year compares with that on hand at the same time in former years.

On Nov. 1st, 1909, 258,500 tons; Nov. 1st, 1908, 116,850 tons; Nov. 1st, 1907, 229,600 tons; Nov. 1st, 1906, 168,600 tons; Nov. 1st, 1905, 157,100 tons; Nov. 1st, 1904, 142,790 tons.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 1900@20.00 |
| No. 1 wheat or wheat & oat | 17.00@18.00 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.50@17.50 |
| Other tame oats | 14.00@15.00 |
| New crop wild | 11.00@15.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.00 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.77½@1.82½ |
| Barley No. 1 | 1.40@1.45 |
| Oats white | 1.57½@1.65 |
| Oats gray | 1.60@1.65 |
| Rye new crop | 1.85@2.20 |
| Cal sm round corn | 1.70@1.75 |
| Alfalfa seed | 16@18 |
| Mustard brown | 3¾@4½ |
| Millet | 2½@2 |
| Flaxseed | 4 |
| Broom corn seed per ton | 23.50 |

### Feed Stuff.

| | |
|---|---|
| Bran per ton | 29.00@30.00 |
| Feed cornmeal per ton | 37.00@38.00 |
| Cracked corn per ton | 38.00@39.00 |
| Ground barley per ton | 30.50@31.50 |
| Rolled oats per ton | 36.00@37.00 |
| Oil cake per ton | 38.50@40.00 |
| Cocoanut cake per ton | 25.00 |
| Middlings | 36.00@37.50 |
| Mixed feed per ton | 28.00@33.00 |
| Shorts | 31.50@33.00 |

## Deciduous Market

SACRAMENTO, Nov. 8, 1909.

The California Fruit Distributors received reports Nov. 8 of fruit sales in the East as follows: Nine carloads sold in Boston, 7 by Distributors; 19 in Chicago, 10 by Distributors; 5 in Pittsburg, 4 by Distributors; 8 in Philadelphia, 7 by Distributors; 1 in Buffalo by Distributors; 1 in St. Paul by Distributors; 2 in Minneapolis by Distributors.

Fruit prices averaged as follows:

Chicago—Tokays, 55c@$1.35; Malagas, 85c@$1.35; Cornichons, 80c; Emperors, 85c@$1.40.

Boston—Tokays, 95c; Cornichons, $1.05.

## Citrus Market

LOS ANGELES, Nov. 10, 1909.

Navels are going forward from Tulare and Butte counties, but are only beginning to arrive in the market and word is not yet received as to how the trade is regarding them. The few Valencias which have been going recently have commanded fair price. So far as can be judged, the Navels will be well received. Southern California navels will not begin to go till the 25th or the end of the month.

Shipments of lemons have nearly doubled in the last few days and there are now ten or eleven cars going daily. This has slightly affected the middle western market and demand is not so keen as formerly. The imports are still arriving, but in small quantity, so that the auctions are taking such as are sent to them at satisfactory prices.

SHIPMENTS.

Total shipments to date since November 1st, 154 cars, of which 97 were oranges and 57 lemons. To same date last year, 96 cars, of which 19 were oranges and 77 lemons.

NEW YORK, Nov. 9.—Eight cars of oranges and one car of lemons sold. The market easier and lower on oranges. Weather clear and favorable.

| VALENCIAS— | Avge. |

## QUERIES.

(Continued from Page 475.)

izer in the stables. Whenever there is any odor of ammonia about a stable or manure pile, then the nitrogen is escaping. Gypsum loosens the soil and adds to its capacity to hold water very greatly. We use from 200 to 600 pounds to the acre. When more is used it does not seem to do any special good. If it goes out to the field with the manure it is not as disagreeable a job as it is to spread it out from the wagons. Where the manure is used the gypsum helps the land by holding the manure more moist. We use gypsum by the carload on the ranch. It goes through the stables and it also goes directly on the land by broadcast. It is cheap, $6.00 to $8.00 a ton at car when bought in carload lots. Spread the gypsum before the plowing and turn it under in the winter for orchard work. I should also sow a crop of peas on land of this kind and turn them under next spring after spreaing a little gypsum, 200 pounds then with 200 at this time will be plenty.—M. E. S.

Send for Sample of
PAGE WOVEN WIRE FENCE

We offer to send, free of charge, an actual sample of Page Woven Wire Fence, just as it comes from the big looms. Each one is "a sermon in steel." The tremendous success of Page Fence which is now on its Quarter Centennial Year, is due to the fact that its makers have always given full measure of honest value. It is the old reliable time-tried wire fence that outlasts them all. Admitted to be the strongest wire fence in existence.

Send today! See the real Page Wire! Get next to the "Page Knot!" Get the great Quarter Centennial Edition of the Page Fence Catalog and learn the difference between Page Fence and the ordinary kinds. Find what Page Fence means in economy. Write at once and both the free sample of Page Fence and the big Catalog will be sent promptly. Address

Page Woven Wire Fence Co.
Box 272K Adrian, Mich.

Double The Quantity of Water

delivered by any other deep well cylinder pump, is raised by the

"American" Deep Well Pump

The reason is it delivers the full capacity of the cylinder both on the DOWN-stroke and the UP-stroke making it actually double capacity. There's a revelation to pump users in our new Deep Well Pump Catalog.

# Veterinary

### Inflammation of Bladder.

My mare urinates frequently, especially when starting with heavy loads, also at certain times almost constantly.

In our neighborhood many horses have died suddenly with no other symptoms than slight swelling on chest or neck. They are often dead within twenty-four hours after the swelling is noticed.—E. C., Alpaugh.

The mare probably has cystitis or inflammation of the bladder. There may be some growths in the bladder or in its neck or she may have stones in the bladder. It will take a very close examination to determine for certain. Would suggest putting the urine into an alkaline condition by giving bi-carbonate of soda in tablespoon doses twice daily, also a half ounce of turpentine in four ounces of sweet oil twice daily.

As for the acute fatal malady you mention, symptoms given are a little too meager for an accurate diagnosis. If you have a county stock inspector in your county, notify him or write to the state veterinarian at Sacramento.—R. T. W.

### Hole in Teat.

I have a cow that has bad her teats cut on wire, leaving holes in side. It has healed, but the whole quarter of the udder seems swollen, and when milked or pressed out, a rather thick yellowish matter runs out of the hole in the side, but the teat doesn't seem sore. The cow will be fresh in a few days. What is the best treatment? Can anything be done to close hole up? I am rubbing teat and udder with olive oil and pressing it out twice a day.—D. M. A., Pixley.

The hole could have been operated on and healed while she was dry, but at present, as she is coming fresh, I think there is nothing to be done but to continue working on as you are doing. An injection of hydrogen peroxide will help to keep it clean, but be very careful about strict cleanliness.—R. T. W.

Owing to destruction by fire of Dr. Whittlesey's place, queries hare been delayed in the answering. If any have been lost and are not answered, the subscribers will please repeat.

### DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, Indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Slt-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

# Business Notes

### CRIMSON WINTER RHUBARB.

Crimson Winter Rhubarb, introduced in 1900, received slow recognition, though it proved all and more than was claimed for it No vegetable ever introduced has proved so profitable.

Rhubarb is the first vegetable we have from the ground in spring. It has a host of friends who fully appreciate its merits, while those who have land and do not grow it are losing one of Nature's choicest and healthiest vegetables. It is the easiest plant to grow of all the perennials. A bed once established will last for 15 years. A half dozen plants will supply a large family during the season, which with Crimson winter is 52 weeks each year. (Common sorts 12 weeks). Burbank says, for growing in California for shipping East, it has been proven to be more profitable than anything the soil produces.

See ad of J. B. Wagner in this issue and write for particulars of this wonderful money-maker.

Fairview Farm Nurseries, G. H. Hopkins and Son, proprietors, Burbank, has just issued a neat catalogue with cover of blue and gold, giving a list of small fruit plants, especially strawberries of which these nurseries make a specialty.

The International Auto Buggy

will carry you the farthest and the longest for the least money.

The International Auto Buggy

is not the lowest priced auto but it is the cheapest in the end.

The International Auto Buggy

has no tire troubles. Its solid rubber tires will not puncture or blow out.

The International Auto Buggy

does not cause continual trouble and repair expense. It gives maximum service at minimum cost.

The International Auto Buggy

holds a record of 5000 miles without any trouble or repair expense whatever.

# "Without a Peer"

says one of our customers, writing regarding his WESTERN engine. Extract from his letter is given below:

"It pleases me greatly to be able to say that the engine recently purchased of you has more than met our highest expectations. Of its kind, it is my belief that it is **Without a Peer** in all the West.

In the purchase of the engine I carefully looked over the market, had seen every high powered combustion in the State, had given every argument due weight, had fully considered costs of other powers—both as to first cost and cost of operation—and now after a good test stand ready to say that I do not think we have made a mistake in securing your engine."

The engine referred to is of the size and type shown in cut, and is used for pumping water near San Francisco, Cal.

## The Automobile Proves Its Value to Farmers

FAR SIGHTED FARMERS appreciate the fact that the world moves faster today than it did yesterday. They realize that improved machinery and up-to-date methods must be used if they would keep abreast.

While time and labor-saving machinery have marvelously widened the range of this productive capacity, the means by which the farmer himself was to keep pace with this progress has been a longer time in coming. The average farmer spends too much time getting from place to place. He works his horses almost as hard whether he is taking a load of produce to the city or just going in on business. The care and attention required by horses incident to a pleasure drive, a trip to church or to town, is just as great as the task of preparing them for work in the field. But the most discouraging fact of all is this—the farmer himself and his family rarely can give any time to recreation.

To give the farm team rest and permit more opportunity for relaxation and pleasure nothing equals the automobile. If the practical automobile accomplished no more than to save a farmer's time, to provide pleasure and health for his family and to leave his horses fresh for that work for which they are better fitted, it would certainly be a good investment. The fact seems to have been amply proved that the dependable utility car actually costs less to keep for service and is much less troublesome to care for than the horse.

Like the telephone, the trolley car and the rural free delivery, the automobile has naturally come to weld a firmer link between the business men of the country and of the city.

When it is considered that the utility automobile possesses such power equipment that it can travel the worst roads in any season of the year, can negotiate any hills which could be climbed with a horse and wagon, and requires but the simplest attention, it seems to be pretty well adapted to the uses of the farm.

The expense of up-keep in some cars has been reduced until today a man can operate a car, spending less for oil and gasoline than the cost of feeding a horse. It is worthy of note that the car is a matter of expense only when in actual operation, and that while in operation its road capacity is at least four times that of a horse driven vehicle.

In point of operating knowledge, even were this not simple enough, the farmer has a great advantage. He is more of a mechanic of necessity than the city man But his chief advantage lies in the fact that he knows something about machinery and is, therefore, able to save the expense of practically all repairs that might become necessary through accident.

# Teach Co-Operation in Our Public Schools

## An Address by J. W. Jeffrey at the Farmers' Week Session at the State Farm, Davis

I SAY entirely in sorrow and not in complaint that too little attention is paid to the principles and influences that affect the sale of farm produce, and that in this respect the agricultural education of the country is shamefully deficient. California, the most advanced in horticultural productions of any state or country, with no material advancement in the study of that branch of farm economics that should promote the successful sale of her products!

The work of our conventions in which I have had some part, the deliberations of our farmers' institutes, the teaching of our agricultural schools and the discussions among the farmers themselves, are minus the most essential feature—the consideration of the elements that influence, make or break the markets. The work of these institutions reminds me of an unassembled watch lying upon a workman's table—the parts beautiful, perfect, essential, every one of them, but without the mainspring. We discuss soil improvement, stock hygienics, plant breeding, insect control, farm management, orchard practice and the attractions of rural life—these lovely, faultless and material parts of our program—as if the mere production of fine cattle, abundant grains, and luscious fruits was the sole end of farming. If this were the only object of our soil activities, the assembled industries of California would run without friction, for there would be no imperfect or missing elements with men each expert in his own field and turning out such handiwork as we see in our various agricultural enterprises; for education, science and the American genius for doing things can be depended upon to regulate and run the farm except in its most essential function—the selling of its products.

You will agree with me that when science and practice have perfectly fulfilled their part in the scheme of farming, they have yet created no wealth and will not have created it until the products of the lands have been disposed of to the profit of the producer and the advantage of the consumer. Then why continue to promote better husbandry, more abundant and superior crops at our farmers' meetings, and neglect an equally essential feature of the farmers' business—if not its only real issue?

What then is to be done with a problem so paramount in importance and yet so neglected as the proper study of selling farm produce? Whence is the material to come from which to build a foundation for better understanding of these neglected features of farm life? I do not know very well, and it may seem presumptuous for me to try to evolve a better standard for our public discussions. But I may at least become for the time being a signboard and try to point the way. Anybody can do that and yet be altogether dumb, and yet the hand may point the right course, however unable to move towards the destination.

The course is education. But what form of education? Surely we cannot continue to build the foundation of a great, paramount and self-sustaining industry upon an education that merely brings us congested supplies of farm products; we cannot build upon that education which concerns itself simply with turning out superior crops and greater tonnage. The end is already in sight for several fine commodities of California which have depended too confidently upon being bidden to a profitable market while the producers waited for this happy event. Most certainly that form of agricultural enlightenment that produces high-grade products must be increased and accelerated, for its fundamentals are as economic to the whole plan as are the basic principles of the barter and trade which it so effectually supplements. We plead for an agricultural education that will have for its corner stone the idea that the farmer must be a factor in the commercial world, and not merely a machine to grind out commodities upon which some one else can make profits. In the past the farmer's functions have ceased at the door of the warehouse or packing house, or at the gate of the stock pen. He is a conservative in the matter of selling his own products at least and has too long been the victim of his own inherited or preconceived opinions.

The farmer's education along the lines of fundamental things relating to his business, becomes more imperative every year. He is now trying to meet individual problems that did not menace his father's prosperity. Circumstances of new and involved transportation problems; of immense aggregations of money reversing the natural laws of supply and demand in which money often demands what it wants and supplies what it wishes to give out and on its own terms; of combinations that prey upon the farmer's business, not because he is a farmer, but because he is helpless—these modern circumstances and many others have reduced him to a position of minor influence in the affairs of the nation both political and industrial, though he is in fact their greatest regulator whenever his united strength can be brought to bear upon the affairs of the day. When he adopts the Missouri idea which will finally bring him to act in masses, then will he be a power for good unto himself and hence to everybody else. But to achieve this happy and absolutely necessary state, if the nation is to endure, the soil tiller must educate himself in all the fundamental principles that affect his financial welfare, which of course include the mastery of farm science, farm administration, and above all of the principles that affect the fruition of his labors—the marketing of his produce.

There should be a department of farm economics at Berkeley or Davis today, teaching the young farmers, yes, and the older also, about the principles of their business as they are now taught about their occupation. This should be done the same as the principles of law or of engineering are taught at the schools devoted to these professions. O, the list of subjects that ought to be taught about farming and are not—it is simply appalling. Just a few examples will show the opportunities that might be found. There should be taught:

1. The broad principles that govern supply and demand concerning farm products, which include proper distribution and the regular serving of customers so that they will neither be injured by high prices or denied the produce when prices are low.

2. The essential difference between the marketing of perishable products and the more stable commodities.

3. That the regular movement of crops at fair prices is the only safety for the farmer's business in the long run and the reasons therefor.

4. That an industry in which each farmer tries to speculate in his own crop, that is, holds for fictitious or exorbitant prices even when temporarily successful, marks the final destruction of the industry, and why this is true.

5. That the production of crops and their sale are two distinct lines but different only as the right and left arm. Both are essential to the welfare and possibly to the existence of the owner.

6. The young farmer should be taught the economic relationship between transportation and marketing. He should realize why he has so little influence with the carrier that takes his crops to market. He should have a thorough understanding of the railroad's side of the case in order to protect his own interests. He should, in short, be instructed in every phase of railroading that affects his business.

7. He should understand how the wonderful progress of invention has increased efficiency and power of the railroads. For example, United States statistics show that in 1884 one freight crew could handle an average of 143 tons; in 1904 by improved machinery and appliances one freight crew was able to handle 310 tons, an increase in twenty years of 117 per cent. of efficiency.

8. That if he entrusts his produce to sale by strangers without bond or recourse of any kind, he may soon be bankrupt. Show him that no successful business can be run on a hit and miss method of selling.

9. The economic influence that steady prices and regular sales have upon the stability of his land values and upon every rural enterprise that may make farm life more attractive and profitable.

* * * *

He should be taught that the old saying, "There is as much room on top for fine fruits as there is for fine intellects," is fallacious. A whole term might be given upon co-operation in all its phases. Indeed this should be the center to which all instruction in economics should tend, for co-operation is becoming absolutely imperative in agricultural lines to offset the influence of great predatory organizations of capital now exacting so much from all unprotected interests.

Imperial Valley Shade Trees.

For use in orange groves and vineyards there is nothing better than the

**Buckeye Fertilizer Drill**

Set of plates furnished **FREE** with each new drill, if desired.

**For Sowing Vetch and Peas**

We have sold a great many carloads of these drills in Southern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired, make it especially adapted to orchard use.

# Citrus and Sub-Tropical Fruits

## DON'T SHIP GREEN ORANGES.

THE new citrus exchange of Florida is taking a strong stand on the evil of green fruit shipments. From a recent statement made by Manager Burton to the members is quoted:

"On my recent trip at every point the trade were emphatic in condemnation of the shipment of green fruit. They all agree that Florida's disaster the past few years is due to the shipment of green oranges, which have killed the demand at the opening of the season. The dealers themselves quit ordering, because they can't sell them, turning their attention to Californias, which are not mature, but have a good color and no seed.

"In all cases I have assured the trade that we are going to hold our fruit back until it is ripe. They all agree that this is the proper course. Several dealers to whom I have been selling oranges for 20 years, who formerly handled from 50 to 100 cars Floridas in a season, advised me that they had quit them entirely, on account of the shipment to them of green stock, followed by stock that would not keep. We have orders from some of these dealers for Thanksgiving stock. They don't want it earlier. It must go out ripe and be handled so as to assure keeping quality.

"In New Orleans I saw oranges from Arcadia on the 18th of this month, too green for consumption. The purchaser who claimed to have bought them at $2 delivered, resold the car to Birmingham for 10 cents advance, the purchaser paying the local freight. The New Orleans purchaser stated that he expected to handle Floridas locally, and did not care to put such stock out in that vicinity. The Birmingham purchaser is in competition with two cars ripe California Valencias that went in the same day at about $2.75 delivered. The shipper of this car of green fruit is a menace to the industry. His handling of the transaction shows that he is not in touch with the conditions, and is playing a game of "blind man's buff." Why did he not know that the market was stocked with ripe Californias selling at $2.50 New Orleans auction? And why could he not have sold Birmingham at $2.35, which was about their cost, instead of New Orleans at $2. It is a fact that California is filling all the southeast with her lowest grade Valencias, which are ripe and sweet, at $2.65 to $2.90 delivered, and that the trade will not buy Floridas in competition with them at this stage of the game. Unless these green Floridas are held back until they are mature, an irreparable injury will be inflicted upon every grower. It is the duty of every grower, whether affiliated with the exchange or not, to use his moral influence in restraining the shipment of green fruit. If your neighbor will sell, let him resist and make it a part of the contract that the fruit shall remain on the trees until it is ripe.

"We are receiving orders daily from our salesmen for cars to be shipped in November—others as soon as the fruit is ripe and good to eat. These are mainly in territory that Florida has lost to California. Our people don't want to get impatient about the shipment of green oranges. Let fruit mature on the trees, and go to market when it is wanted. The outlook is very good everywhere. New Orleans has about 300,000 boxes to go forward, but there has been more or less damage to the crop by the recent storm. This fruit will be practically out of the way before the crop begins to move from Florida. California has a shorter crop of navels than last season, and their growers will be slow to move. If we can get our fruit to moving freely and consumers in the habit of eating Florida oranges, they will take them in preference to green, sour oranges from elsewhere. Florida's problem is to overcome the prejudice that has been created against her oranges. It is a matter of handling the first shipment with discretion.

"Throughout this country and Canada the trade as a whole has expressed satisfaction with the efforts of the growers in forming the exchange, as they hope through that medium to see the Florida orange put upon the market in a businesslike way. Many have expressed confidence in the business management of the exchange, and are particularly pleased that the Florida Citrus Exchange is following conservative lines that have been worked out by California, which are familiar to the dealers, and have proved profitable. There is some effort being made by ill-advised newspaper writers to prejudice the exchange movement with the trade by misrepresenting its attitude toward commission concerns. As a matter of fact, this organization is making no fight upon any other plan. It is attempting to so systematize the handling of the Florida orange and grapefruit crop as to make it profitable and pleasant to every factor identified with it. We have no fight to make upon any man or set of men. But we are trying to so shape the trend of the business as to command the confidence and support of every factor that can assist in the proper movement of the crop."

## "IMPRESSIONS RELATIVE TO AVOCADO CULTURE."

THAT the Avocado or Alligator Pear can be grown successfully in Southern California has, I think, been fully demonstrated so far as time and the nature of the case permit. The prolificness and profitableness of the Walker tree at Hollywood and the Chappelow tree at Monrovia, as well as the behavior of some trees of my own and elsewhere, all indicate its adaptability to this region. All the bearing trees that we have are seedlings, however. I do not know of any budded trees which are yet of sufficient age to show what they can do, though there are some which should be heard from before long. Budding the Avocado is successful in Florida, though it is said that there the tendency is to dwarf the tree. That may prove true here also, though perhaps only of certain varieties, or the dwarfing may be only temporary effect of the shock of cutting back and the tree will recover in time. It often happens that the Avocado is slow in adjusting itself to the change of

either transplanting or severe pruning. Should dwarfishness prove a habit, the obvious remedy is to plant nearer together, which will prove to be an advantage when it comes to picking the fruit, for the seedling Avocado is a large tree and the fruit on old trees often difficult of access.

There are, broadly speaking, two types of Avocado in California—the thick skinned and the thin skinned. Of these two the thin skinned kind usually ripens from August to December. The fruit ranges in size from that of a pullet's egg to that of a goose egg, and while a few are green, the color is in most cases approximately violet, purple and dark red. The foliage is almost always green the year round and the leaves long in proportion to their width. The general rule for the thick skinned is that the fruit matures from February to June. Almost invariably they are larger than the thin skinned and fully equal in flavor. The average weight in California is from three-quarters to over one pound. The color when mature is generally green, with perhaps a slight yellow tinge, though I know of one that is purple and one that is nearly white. The leaves of this type may be said to be always oval, and in many cases the tints of the new leaves when they first appear and until they are fully matured are of an exquisite maroon or white color, so that for several months they are especially beautiful and valuable as an ornamental as well as useful tree, and indeed they are beautiful at all times. In this respect they are like their near relative, the Camphor, whose fruit is a miniature Avocado, being built on precisely the same lines except as to taste.

The intending Avocado grower should be very careful about the selection of seeds and young plants. Do not waste time over seeds which have been imported from anywhere except Mexico, and if possible get those which come from the table lands of that country, whose climate is much like our own. Such seeds, together with those of local origin, will give trees which are virtually acclimated and the chance for fruit will be of the best. I know of no trees in California which are bearers at all unless of Mexican antecedents, though others sometimes grow well and make fine trees.

Do not hurry unnecessarily in selecting trees to bud from. Some have done well, to be sure, but there are many shortly coming into bearing, some of which will almost certainly be superior.

My plan is to plant an orchard of seedlings and expect to bud them at about four years of age, selecting the best buds available at that time.

While I try to have a variety of kinds for household use, which will prolong the season as much as possible, when it comes to the commercial orchard I hope to have it composed of some hard skinned sort, ripening from December to June, a regular annual bearer, with a seed which does not rattle round inside, and averaging about one pound in weight. Such a kind would prove the best shipper and the season the best for high prices.—C. P. Taft in Pacific Garden.

## PAPAYA JUICE.

Papaya juice is extracted from the fruit of the papaw tree, which grows rapidly, attaining its full bearing capacity in a year. It produces from 40 to 50 papaws of a dark green color, ripening to a deep yellow, in shape resembling a squash. A very light superficial incision is made in the fruit, and a clear water-like juice exudes therefrom, which becomes opaque on exposure to the air. As it drips from the fruit it is received in a porcelain lined receptacle. As it is very corrosive, metal receptacles would injure its appearance and qualities. It possesses great digestive virtues, and the refined article is considered superior to all animal pepsins.

After the desired quantity has been collected, the juice is placed in shallow porcelain or glass-lined pans and allowed to evaporate. While this is not a very delicate or difficult operation, it requires considerable attention, so that the juice will dry uniformly and the product be white and well granulated. In its granulated state it is shipped to the United States where it undergoes a refining process, and is sold as the papaw of commerce for medicinal purposes.

The ripe papaw is palatable and an excellent aid to digestion. Meat wrapped in papaw leaves for a short time becomes quite tender without any impairment in appearance or taste.

In extracting the juice the hands should be protected by rubber gloves, as in its crude state it attacks the tissues. An average tree will produce about one-fourth of a pound of the granulated juice. It sells in the United States for from $4 to $6 per pound in the crude state. —Philippine Agricultural Review.

**The Buying of Citrus Trees**

Is a Simple Problem in Economics

You cannot extract sunbeams from cucumbers, nor blood from stones, nor good crops of fine oranges and lemons from inferior trees. A poor tree is an expensive experiment entailing only vexation of spirit and a dwindling pocket book. Then why experiment with stock of doubtful quality? Why not get the best and be sure of the future? For 20 years we have been supplying the people who grow good citrus fruits with their trees in every citrus growing section of the world, and stand ready to serve you equally well. Why not write us and let us become better acquainted

The economics of successful orange and lemon growing is tersely explained in our book, entitled, "The Citrus Fruits: Historically, Horticulturally and Commercially," a copy of which is yours for the sum of 25 cents.

# Deciduous Fruit Culture

## PROTECTING TREES FROM RABBITS.

MANY fruit and shade trees are lost annually by being girdled by rabbits. The season in which most of the damage is done is during the winter months. As that season is approaching it would be well for the orchardist to have in mind some form of protection for his trees in order to prevent such a loss.

With regard to remedies, there are several advocated and these are usually of two forms. The trunk of the tree is either painted with some solution or wrapped with some material. Many patent protectors are on the market such as wire coils and thin sheets of wood. The wire coil protector slips over the tree and can be left on the year around and until the tree gets too large for the coil. Then it must be removed. The price of these protectors is about $2.25 per one hundred. When the sheets of wood are used they are put on the trees in the fall and are removed in the spring. A strip of the wood sufficiently large to extend around the tree is used. It is tied on with some kind of cord, care being taken to tie it firmly so it will stay. There are many more methods of protecting trees than the above, but only the two used at the station by the horticultural department will be described in this bulletin. These are as follows:

Lime wash with arsenate of lead. Paint the trunks of the trees with lime wash made rather thick to which has been added about one-half pound of arsenate of lead to each pailful of the wash. The lime wash is made in the usual manner by mixing lime and water. After adding the arsenate of lead the whole mixture should be thoroughly stirred to mix the poison with the wash. This wash is put on with an ordinary paint brush and the trunk of the tree should be covered as high as the rabbits can reach. It should be renewed if there is any indication of injury to the trees by rabbits. One-half pound of Paris green may be substituted for the arsenate of lead.

Wrapping Trees With Paper. The trunks of the trees are wrapped with paper, the paper being tied on with cord to hold it in place. Old newspapers may be used for the above purpose, the care necessary being to see that the paper entirely covers the trunk of the tree high enough to prevent the rabbits reaching the exposed portion above the paper.

The two last remedies mentioned and described were used during the past winter and spring at the station and they gave entire satisfaction. The latter method of wrapping the trunks of the trees with paper is the cheaper of the two and if the proper care is exercised in putting on the paper, no other protection will be necessary. The paper should be removed in the latter part of spring after danger from rabbits gnawing the tree is past.

The planter in exposed situations should not fail to pay particular attention to this matter of protecting his trees. A little care expended along this line will save his trees from injury, and will more than pay the expense.—J. E. Mundell, New Mexico Col. of Ag.

## FRUIT BUDS AND FROST.

MANY people are curious to know how buds on fruit trees may burst forth into what appears to be full bloom after it is known that the crop has been ruined by frost.

In order to understand this it is necessary to understand the makeup of a flower. In the very center of the flower is found the part which develops into fruit. This has from one to several stem-like parts, called styles, which project above the surface of the flower. The immature fruit with its style or styles, for it will be found to have five in the apple and pear and only one in the stone fruits, is called the pistil. Next come other slender organs, the stamens, which bear sack-like bodies on their ends. Pollen is produced in these sacks or anthers and is the material out of which bees make bee bread. In order that fruit may be produced it is necessary for pollen to be deposited on the ends of the pistils. Here, if conditions are suitable, the pollen grains germinate much like seeds and the germ tube works its way down through the pistil and into the immature seed, where fertilization is accomplished. This is where insects are valuable to the fruit growers, for in a great many instances the parts of the flower are so constructed that the transfer must be made by mechanical means. So without insects to do this work for us some kinds would fail to produce satisfactory crops of fruit.

It will be seen from the above that the pistils and stamens are the essential parts of a flower. None of the other parts are necessary to fruit production. It is generally considered, however, that the brilliant parts are useful in attracting insects. But they may be cut entirely away without injury to the young fruit; in fact, this is quite commonly done in plant breeding.

The young pistil is the most sensitive to frost of all the parts of the flower, and it must be examined before injury can be detected. If it has been injured it will be found to be shrivelled and discolored. The condition of the fruit buds can be determined at any time during the winter by this means. But while the pistil may be dead the petals are often uninjured and may expand as though the blossom were capable of setting fruit. With a little care anyone can determine the condition of the fruit buds in his orchard and all will find this knowledge a source of much satisfaction.—W. Paddock, Colorado Agricultural College.

## NUT GROWERS CONVENTION.

The Eighth Annual Convention of the National Nut Growers Association, held at Albany, Georgia, was one of the largest and most successful in the history of the organization. The membership roll was increased fully thirty per cent.

Officers elected are as follows: President, J. B. Wright, Cairo, Ga.; Secretary, J. F. Wilson, Poulan, Ga.

## FRUIT IN THE DIET.

A LONG time ago a man said—I suppose it was a man since it is only of recent years that women have expressed opinions on food topics—a man said: "Fruit is gold in the morning, silver at noon, lead at night," and so because of that delusion we have been cheated of much palatable nutritious food. Now if my opinion were asked, I should say, "Fruit is gold morning, noon, night and between times." While doubtless the small boy would rejoice, the dyspeptic would groan, and I should be obliged to add a few provisos. Fruit is gold when properly combined with other foods—when it is thoroughly ripened—or properly cooked.

As to combinations, we will divide fruit into acid and subacids:

Acid—Sour oranges, plums, lemons, sour cherries, strawberries not thoroughly ripe, sour apples, currants, gooseberries.

Subacid—Prunes, dates, figs, raisins, bananas, peaches, apples, grapes, berries, pineapples.

The acid fruits should not be used in combination with starchy foods, such as cereals, rice, cornstarch, etc., for starch digests in an alkaline juice, which the acid would tend to neutralize and thus cause indigestion. Starch digestion begins in the mouth and is finished in the intestines. The digestive ferment in the mouth is alkaline, while that in the stomach is acid. Protein foods, meats, eggs and milk digest in an acid juice which is in the stomach, hence acid fruits with meat—cranberries with our turkey, apples with pork, currant jelly with beef and mutton—would tend to aid rather than to hinder digestion.

I sometimes meet people who insist that they cannot eat fruit—that it does not "agree" with them. Nine times out of ten inquiry reveals that such people are accustomed to eat excessive quantities of sugar with their fruit. Indeed I have come to believe that fully 60 per cent. of us do not know genuine fruit flavor, so general is the habit of disguising it with sugar. Sometimes this is the fault of the cook; but very often hurried eating prevents the appreciation of fine flavors not only in fruit, but in the vegetables and other food. We try to supply the apparent lack by adding sugar, or salt, pepper and spices. Elderly persons are much given to eating a large amount of salt, a habit which, probably had its rise in an improper habit of eating too fast.

When much sugar is eaten with fruit, or with cereals, it is almost sure to cause fermentation, for which the fruit or cereal receive the blame instead of the sugar to which it rightfully belongs. Cane sugar—by which is meant all commercial sugars—must be digested; while the sugar of ripe fruit known as "grape sugar," is ready for assimilation as soon as it reaches the digestive tract.

### Dried Fruits.

When we advocate the daily use of fruit—fresh fruit when it is obtainable—some one is sure to ask "where will we get it?" I know of but one way, and that is to plant more trees, bushes and vines. One woman I know who lives in town has grapevines growing on her back fence and back porch. She says, "A back fence is not a beautiful thing; a grape vine is beautiful, so why not cover the fence with the vine?" Sure enough! Why not?

"But to resume and continue on"—if we have not fresh fruits, we must substitute dried. If the best ways of preparing dried fruits were more generally known, they would be in greater favor.

We associate prunes with cheap boarding houses, and think of a hard, tasteless chunk floating in a brown, sweetened liquid. I mention prunes for it is the most abused of dried fruits .

Try this way of preparing prunes, and if you have been used to the boarding house variety you have a surprise in store.

Wash the fruit through two waters, using about one quart of water for a pint of prunes. Then put them into the cooking vessel with enough cold water to cover. The amount will vary ith the shape of the vessel—generally a quart of water to a pint of prunes; let them soak over night. Stand the cooker on the back of stove where the fruit will heat as soon as the fire is built. Keep hot all day. Do not allow it to boil, but keep just below boiling point. Do not add any sugar. If the water has not cooked away enough to make a thick syrup at the end of the all-day cooking, drain it from the fruit and cook down in a separate vessel. Pour over the fruit, cool, and serve. Keep the sugar bowl out of reach and learn the real taste of richness in the fruit itself. This way of preparing will apply to all dried fruits excepting raisins and apples.

Raisins should be put to cook in cold water to cover, allowed to boil five minutes after boiling point is reached, when they are ready to cool and serve.

Dried apples are, as a rule improved by a small amount of sugar and a suggestion of spices or lemon peel.

Figs bought in the five-pound cartons may be prepared in the same way as prunes are and canned. I find it convenient to use pint cans. The fruit is so rich that a small serving suffices.

### Fruit Combinations.

Cereals are almost universally used as part of our breakfast menus. Perhaps they grew monotonous and made us seize with such avidity the prepared foods which have been flooding our markets. If the cereals are served with fruits the family will never complain of monotony. Remember, however, to use the subacid fruits. Try some of the combinations:

Wheat preparations—with stewed raisins, bananas, dates, or stewed figs.

Oatmeal or rolled oats with baked apples or dates.

Do not serve a great quantity of the fruit with the cereal, hardly enough to change the flavor, two tablespoons of the stewed fruits to four persons. Two baked apples or two bananas to four persons being the right proportion. Dates should be seeded and cut fine. Add the raisins, dates or figs to the cereal a few minutes before serving. The bananas or baked apples should be served in each individual dish instead of being "mixed" with the cereal in the cooker. At least twice a week have fruit instead of the cereal. Fresh if your market and purse allow; or canned if it is in your store house. If neither of those resources then the dried fruits.—St. Jo. Fruit Grower.

We carry a most complete line of **Fruit and Ornamental Trees, Berry Bushes, Roses, Perennials, Bulbs, etc.** Low prices. Best quality stock only. Pacific States varieties of Apples, best one year trees at $6.00 per 100. Peaches $5.00 per 100. We pay freight on $10.00 orders.

Also, very large and complete stock of **Farm, Vegetable and Flower Seeds** to select from. Write for big 112 page catalogue and Garden Book. Mailed FREE to anyone interested; also, free sample packet of "New Coreless" Tomato, the best of all tomatoes.

**GERMAN NURSERIES AND SEED HOUSE,**
**Box 54, Beatrice, Neb.**

## Strawberry Plants

**Bred in California**

Will yield more berries, and have fewer runners than eastern stock. Breeding plants carefully selected each year and not allowed to fruit.

## Superb--Everbearing

We have Brandywines, Jessie, Marshall, Burbank Beauty, Excelsior, Enhance or A1, Lady Thompson, Klondike, Mrs. Miller, Hummer, August Luther, Commonwealth and Pride of Cumberland.

Send Stamp for our elegant new catalogue containing description, prices and cultural directions.

## G. H. Hopkins & Son

**BURBANK, CAL.**

## Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon application.

### THE SPIDER IS A BENEFIT.

WHENEVER nature has planned to perpetuate a species through the ages she has also schemed to check its undue increase, rarely permitting, for any length of time, a multiplication beyond easily supported numbers. There has rarely ever been a scarcity of food, and this has not entered into the problem; she has, therefore, adopted other methods, and these have been effective, so much so that the destructive has sometimes overmatched the creative, and this often through the agency of predacious species.

We commonly think of the tiger, the shark, the weasel, the hawk, the snake, as creatures that prey upon others, but blood-thirstiness is even more exemplified in the insect world by the adephagous robber-flies, hornets, long-billed assassin bugs, and caraboid beetles. And then we have the spiders, killers all of them.

It is deservedly popular to defend and extol the birds. They are beautiful things, the chiefest and best performers in nature's orchestra, and all that sort of thing, and they do a wonderful lot of good for man. But did you ever think that birds are in the insect-destruction business for their own stomach's sake, not ours, that they are not economic entomologists, and that many harmless and very beneficial insects suit the avian palate as well and very often better than do the noxious species? This limits the good that the birds perform, and the same can be said, also, of all insectivorous animals.

Since time prehistoric, ever since the human species developed the sense of comparison and an eye for form, all spiders, with a resemblance to the big, hairy, ugly creatures reputed to be poisonous and now generally known by the name "tarantula," have been the victims of the crushing heel.

I think it can be said that there never has been one absolutely authentic case of spider bite. The so-called spider bites received occasionally, and generally in early summer, often in bed, are inflicted by certain blood-sucking insects of several species, large and small. The mandibles of the average-sized spiders are hardly powerful enough to pierce the human skin, and all of the poison contained in an arachnoid's glands, injected into the flesh of a human being, will not make as much fuss as a respectable bee sting. Moreover, spiders are not mammal blood suckers, and wouldn't bite if they could. So much for the negative qualities of spiders.

If it were not for the spiders we should all promptly starve to death. Perhaps this is a little startling; it is none the less true. To enlarge upon it, certain spiders prey upon certain caterpillars, regularly inhabit their abodes, and kill so many of them that often whole colonies of the insects are wiped out of existence. These caterpillars normally feed upon the leaves of trees, bushes, and shrubs, frequently entirely denuding a plant. If they were plentiful enough to exhaust their common food they would turn to the weeds and grasses. Without check of any kind they would overrun the earth and destroy every green and growing thing. The spiders beautifully preserve the balance of nature.

Kill all the spiders and mankind is doomed.—Colliers.

**Placer County Berries.**

## Eucalyptus

We have the following varieties in stock at this date.

Eucalyptus amygdalina (Peppermint Gum);
500 Cornuta (Yate Tree);
Crebra (Narrow-Leaf Ironbark);
168,000 Globulus (Blue Gum);
Goniocalyx (New South Wales Blue Gum);
1000 Leucoxylon (Victorian Ironbark);
3000 Polyanthema (Red Box);
1000 Resinifera (Red Mahogany);
700 Robusta (Swamp Mahogany);
32,000 Rostrata (Red Gum);
13,100 Rudis;
53,300 Tereticornis (Forest Red Gum);
28,000 Viminalis (Manna Gum);

### FINANCIAL ADVANTAGE FROM TREE PLANTING.

TOUCHING upon the matter of trees along the roadside and their addition to the appearance of any community Prof. C. F. Baker writes this to his home paper, the Courier of Claremont.

Cutting out all esthetic considerations, which alone weigh heavily with many, and reducing the whole matter to a cold-blooded proposition, trees and shrubs on any residence property in any town or city represent most distinctly an asset expressible in dollars and cents. Other things being equal is there any doubt of the decision of a possible purchaser between two lots, one of which is barren of trees and in a dirty abandoned condition and another clean and well kept and with a few good trees and shrubs? The actual cost of swinging a scythe over a lot two or three times a year is altogether trivial and it makes the lots worth more. Likewise the initial cost of trees and shrubs is trivial, and sorts can easily be selected that will do well with a minimum of water and care. A lot kept clean and tastefully planted, adds several hundred dollars to its price and you will get it. I have known of men who have contracted to do this work at absurdly low figures for all vacant lots in several towns, and it paid the owners and all the interests of those towns, public opinion practically forcing some degree of improvement in all vacant property. Even in the case of long-time holdings, lots could be made to pay their own taxes and yield a profit from the planting of trees for firewood.

During this summer I made a visit to the town of Northfield in Minnesota, where, at an early day in its history some exceedingly wise, canny, and far-seeing men decided to plant the residence district to solid avenues of maples and elms. The result is one of rare beauty—even magnificence—and of incalculable actual money value to the property interests of the town.

Even if the planting could only be unlform for a single block in length, it would be an immense advance over the condition now existing in a large part of our town.

It avails little to plant trees and shrubs if they are not to be taken care of, but exceedingly little care is necessary to shape up a good tree. It all depends on the first few years—after that it is often too late. It usually does not take five minutes per tree per year to give the tree a proper shape. Some of the trees we use in yards and streets live in a natural state in groups and thickets, and when placed alone, will, like some of the acacias along our streets, become completely misshapen unless given a little attention. Some of the eucalyptus like ficifolia, calophylla, and robusta, often act this same way. Robusta is commonly condemned as a street tree, though with a little care it could easily be given as fine a form as any eucalypt. There are some trees that make fine tops with almost no attention, such as the black acacia, camphor, bottle-tree, umbrella tree, and a few of the eucalypts, but the majority of trees, will absolutely need, or be greatly benefited by a little pruning each year. It pays to plant trees and to take care of them!—C. F. Baker.

The California Poppy.

### TULIPS.

The character of this class of bulbs is only beginning to be understood in Southern California. After years of experiments, mostly unsuccessful and disappointing, we have learned that early flowering varieties are not adapted to our climate, it being a waste of time and money to plant them. The late flowering sorts are quite as fine here as they grow "back east."

Heavy soil, either clay or adobe, seems to produce the finest flowers on stems 12 to 20 inches long and should be planted six inches deep, with a little sand in the bottom of the trench and a liberal covering of stable or dairy manure on top of the soil, the fertility of which will leach to the bulbs.

If sweet alyssum or forget-me-not be planted on the bed about December first their small flowers and foliage will form a pleasing contrast to those of the tulips and lend a charm to the bed it will not otherwise possess, but plant the tulips now.—Pacific Garden.

Coachella Valley reports her oranges now fully ripe.

## $1000 to $1500 Profit per Acre

Can be made on Crimson Winter Rhubarb. It is one of California's most profitable products. We make this statement after actual tests. We have made a study of the production of

**Crimson Winter Rhubarb**

and find it easier to grow and less care and labor than corn or pumpkins. Plant an acre and reap an annual harvest of $1000 to $1500 or plant several acres and become wealthy in a few years.

J. B. Wagner

Better than a gold or any other mine.

# Irrigation and Forestry

## TEACHING NEED OF FORESTRY.

TEACHERS throughout the country have been invited by the United States Forester to co-operate with the Forest Service in an effort to obtain more definite knowledge of the characteristics of the most important forest trees of the United States. To do this it will be necessary to obtain a large number of volunteer observers who will collect material on the time of leafing, blossoming, and fruiting of the various kinds of forest trees. In his letter inviting the co-operation of the teachers, Forester Pinchot says:

"Knowledge of this kind is greatly needed and will be of value from the standpoint both of education and of practical forestry. For educational purposes the results obtained for each species, averaged and presented graphically by means of colored charts, will be available to all who are interested in the subject, and particularly to schools. They will form virtual "tree calendars," and will be valuable aids to nature study.

"Children can be readily interested in the actual work of obtaining records. This should form an attractive outdoor feature of the school work that should serve to develop the faculty of accurate observation, and at the same time to promote an interest in forestry which may lead to a better appreciation of its aims and methods. It may also prove to be a profitable addition to botany courses for older students.

"A study of this kind will be of great value to practical forestry, since the proper treatment of forests depends partly upon a knowledge of these characteristics of trees. For example, the time of year at which a tree leafs out and blossoms is one of the indications as to whether or not it is frost-hardy in a given region, and the length of time that a tree is in leaf influences the growth it is able to make during the season. Knowledge of the time when seeds of each species ripen in various localities is of great value to those who are collecting seed, since seed often deteriorates or is eaten by squirrels and birds if not gathered and stored as soon as ripe.

"Another result of this study will be a more intimate knowledge of climate as manifested by plant growth, for differences in climate are shown by plant life as well as by instruments, and a preliminary idea can thus be gained as to whether a given region is suited to a valuable tree which it is desired to introduce there. Many such examples could be given, but sufficient has been said to show that the results of these observations will be a real help to practical forestry, in addition to their general interest and educational value. Volunteers will later be supplied with publications and charts containing the information they help to gather, as a return for the services rendered."

## HOW HARDWOODS DECAY.

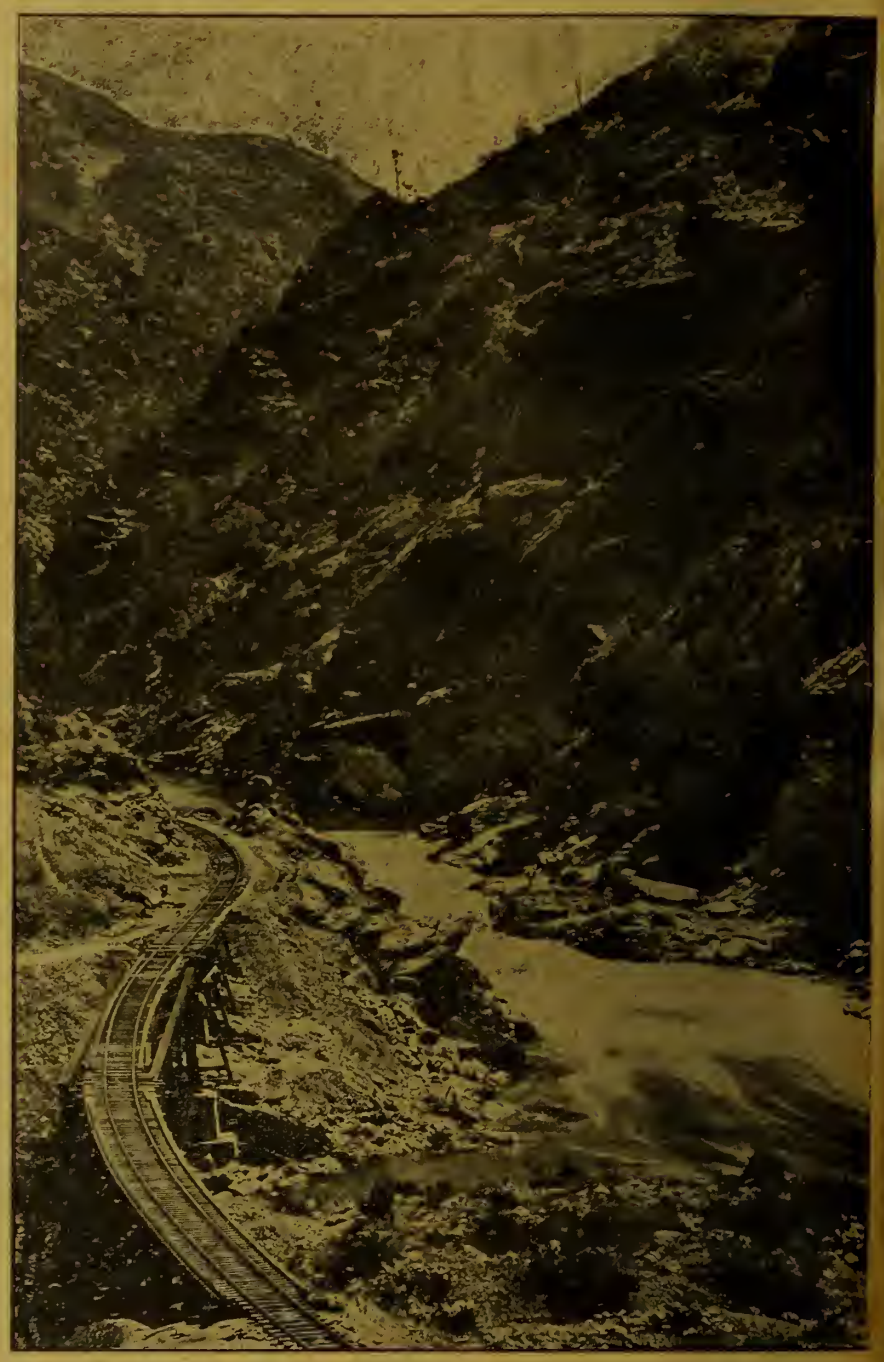
Hardwod trees in the forest are attacked by many enemies. The mistletoe, the "witches' broom," and the southern mosses are all parasites that weaken and even destroy the trees. But by far the greater number of diseases of trees are caused by fungus growth. Some fungi destroy the leaves, some rot the roots, and some girdle the bark. Chestnut orchards have been destroyed in many places in the East by a kind of fungus which girdles the bark and kills the tree.

Then there are many kinds of fungus which rot the wood of standing trees, with no outward sign until after the value of the tree has been destroyed. The white heart-rot is the most common of these. It attacks the oak, walnut, hickory, beech, maples and many other trees. The heartwood of the tree is changed by the action of the fungus into a light-colored, flaky sort of substance which has no strength and can no longer be called wood. Such a tree may live for many years, even though badly diseased, but it has no value for timber.

The outward sign, when it does appear, is a shelf-like growth upon the trunk. It is hoof-shaped, about as thick as wide, and may be anywhere from 1 to 2 inches wide to 12 inches or more. The upper surface runs from brown to black, the lower surface from gray to red-brown. Wherever such a tree is found it should be removed at once, for the longer it stands the less it is worth for timber, and it will surely spread the disease to other trees. Any sort of wound in a sound tree, such as a broken limb, gives an opening for the fungus to enter and establish itself, unnoticed until the heartwood is destroyed. Wherever such a wound can be promptly coated with hot coal-tar creosote, or some other good antiseptic substance, it may be saved from infection.

Timbers are also subject to attack from many kinds of fungus. Indeed, fungi are the principal cause of decay in structural timbers. They enter the timber by means of checks and live upon the wood, breaking it up until its strength is gone. Railroad ties in the roadbed often appear perfectly sound, although the whole center has crumbled.

After timbers have been cut from the log they should be dried as rapidly and evenly as possible so as to remove the moisture and prevent checks. Wood should not be placed in contact with the ground until it has been thoroughly dried. Otherwise some fungus will enter and cause rapid decay. Where large timbers are needed, they will be less liable to decay if built up of several pieces; for instance, instead of using a 12 by 12 piece, use four pieces 3 by 12, bolted together. Timbers can be even more effectively preserved against decay by chemical treatment with creosote and other substances.



A Mountain Canyon

The supervisors of Madera county are distributing poison to farmers and urging a persistent fight on ground squirrels.

**Rex Lime and Sulphur Solution**

**The Famous Insecticide and Fungicide**

It has been found that Rex Lime & Sulphur Solution used in the early part of the season is as effective for Blight as the Bordeaux Mixture, and it does not have the injurious effect upon the tree as Blue-Stone. In Oregon and Washington the use of Bordeaux is being entirely eliminated and lime and sulphur solution used for all purposes. The leaves are falling from the trees, and especially the Peach, Almond and Apricot should be immediately sprayed for the first spraying. The second spraying should be done on all trees just before the buds open in the Spring.

Rex Lime & Sulphur Solution is a guaranteed article; properly prepared; free from sediment, and as cheap, if not cheaper, than the farmer can make a mixture himself.

For particulars inquire of your dealer or write to the factory at

## HEAVY DRAINS ON NATION'S FORESTS.

"THE TOTAL yearly drain upon our forests, not counting losses from fires, storms, and insects, is some twenty billion cubic feet," says R. S. Kellogg, assistant forester in charge of the office of forest statistics, in a publication just issued by the Forest Service on "The Timber Supply of the United States."

"Our present forest area of 550 million acres may be roughly estimated to consist of 200 million acres of mature forests, in which the annual growth is balanced by death and decay, of 250 million acres partially cut or burned over, on which, with reasonable care, there is sufficient young growth to produce in the course of time a merchantable, but not a full crop of timber, and 100 million acres of more severely cut and burned over forests, on which there is not sufficient young growth to produce another crop of much value.

"Taken as a whole, the annual growth of our forests under these conditions does not exceed twelve cubic feet per acre, a total of less than seven billion cubic feet. That is, we are cutting our forests three times as fast as they are growing. There is menace in the continuance of such conditions. While we might never reach absolute timber exhaustion, the unrestricted exploitation of our forests in the past has already had serious effects, and it will have much worse if it is allowed to continue unchecked.

"White pine, for instance, which was once considered inexhaustible, has fallen off seventy per cent in cut since 1890, and more than forty-five per cent since 1900. The cut of oak, our most valuable hardwood lumber, has decreased sixteen per cent since 1900, and that of yellow poplar twenty-two per cent. The same story will be told of other woods if they are not conserved.

"The fact that timber has been cheap and abundant has made us careless of its production and reckless in its use. We take 250 cubic feet of wood per capita annually from our forests, while Germany uses only thirty-seven cubic feet, and France but twenty-five. On the other hand, Germany, who has learned her lesson, makes her state forests produce an average of forty-eight cubic feet of wood per acre. We have as fast-growing species as Germany, or faster, and as good or better forest soil if we protect it.

"The necessity for more farm land may eventually reduce our total forest area to 100 million acres less than it is at present. It is entirely possible, however, to produce on 450 million acres as much wood as a population much greater than we have now will really need if all the forest land is brought to its highest producing capacity and if the product is economically and completely utilized. But to reach the necessary condition of equilibrium between timber production and consumption will take many years of vigorous effort by individual forest owners, by the States, and by the National Government. None of them can solve the problem alone; all must work together."

---

The Tulare county board of trade is planning for an extensive exhibit of the products of the county at the Citrus Fair to be held at Dinuba beginning November 29th.

# Bees and Their Care

### HOW TO BUY BEES.

In looking for colonies to buy it is well to select them from yards in the vicinity of the place where we expect to establish an apiary, if such can be found, for in this way no more bees are brought into the locality. This is a strictly business proposition, and the amount that one can afford to pay extra for colonies that are already within perhaps a mile of the proposed apiary is a little hard to tell. The number of colonies a location will support, and the number already there, are determining factors. If the beginner has any doubts as to whether the location will warrant his bringing in new colonies, he should buy them near home, even if the price is twice what it would be at a more distant point.

During my early experience in bee-keeping there were a good many small apiaries around me, isolated from other yards, so that the bees had unlimited pasturage; and these few colonies in a place always gathered more surplus honey than those in the main yards where perhaps a hundred colonies were kept. The fewer bees in a given location, the larger the crop of honey, other things being equal.

#### When To Start.

An inexperienced bee-keeper need not hesitate to buy bees any season of the year. Some of the best bargains are found in the fall, for it is then much easier to buy bees than in May, when the prospect of a honey crop is near at hand. However, for one without experience, May is the best month to purchase bees, for he will be sure of having them through one surplus season at least before he has the wintering problem to contend with, and this much experience will help him in the solving of the wintering problem.

#### Not Necessary To Buy Old Hives.

When buying bees, see that the combs are in good modern frames of Langstroth size. The hive is of secondary importance; for if the combs are of the worker size, and straight and true, they can be transferred to frames in new hives. This is the way most of our buying is done; for after the bees are transferred the old hives are returned, for we do not want them. If the beginner were to buy three or four old hives, and use them in connection with new ones, they would never be satisfactory. It usually happens that bees can be bought enough cheaper without the hives to make it more economical all around to buy new hives outright.—Gleanings.

### HOT OR COLD UNCAPPING-KNIVES

Whether an uncapping-knife should be hot or cold is a question that can not be answered by saying that one way is better than the other; but, as a rule, I think that the knife should be cold. This statement, I know, is not in accord with the views of many bee-keepers in the West and some other parts of the country, perhaps. In my mind, I can see the bee-keeper on the Pacific coast as he says, "Well, I should like to see you uncap sage honey with a cold knife;" but I should like to ask such a person when he ground his honey-knives last. His reply probably would be that the knives were ground some time last season.

To uncap honey the knife should be sharp and clean. If it has these two qualities, and is in the hand of a person who knows how, almost any kind of combs can be uncapped as fast as the largest extractor now made can extract them.

The way to uncap honey is to have two knives ground sharp and clean. The knife that is not in use should be placed in a pail of water, and when the knife that is in use becomes dull and gummy, after perhaps from half an hour to three hours' use, the time depending on the kind of combs, it should be changed for the other one. Each time the knives are changed a moment's time should be spent on the blade with a whetstone. Not only should the edge be brushed up, but the whole blade should be gone over to remove the gummy coating that has formed, for it is this gummy coating that causes most of the trouble.

Of course, there is honey that can not be uncapped with a cold knife, but it is not honey that has been recently gathered. I have yet to see honey that has just been gathered that can not be uncapped with a cold knife.

And now as to the way to cut the combs. Only the upper edge of the knife should be sharp; the lower edge should be dull, so that it may be used for trimming the wax off the top-bar. Do not uncap with a sawing motion unless the comb happens to be an old black one that can not be uncapped otherwise. A draw cut is much faster and smoother.

The advantages of working with a cold knife are many. No oil-lamp is needed to heat up the extracting-house, and possibly set fire to it; there is no changing of knives every comb, and, last of all, more work can be done and with much less bother.—Gleanings in Bee Culture.

### A NECESSITY.

Honey has a great sweetening and otherwise delectable power. Many look upon it as a luxury, and sugar as a necessity. At present the latter is true enough, but I wish I might do something to change the former. It is not expensive, needs no dissolving, cooking or manipulation. It has different flavors according to the variety of flowers from which the bees have gathered it, but almost all are proverbially pleasing.

Sugar, candy and syrups, as well as sweetened medicines, have been much adulterated. But a jar of honey labeled "pure" is pure. Almost all bee keepers who raise honey in sufficient quantities to be able to place it before the public, are members of national or state associations, are very jealous for the absolute purity of what is upon the market, and are urged to this by every bee keepers' magazine in the country.—Ex.

If the apiary is operated for extracted honey, use a queen-excluding zinc between the brood nest and the extracting supers, as this prevents the presence of brood in the extracting supers—a positive nuisance in extracting.

# CALIFORNIA CULTIVATOR CLUBBING PRICE LIST

## Good Until October 1, 1910

Periodicals in any club offer may be ordered to the same or different addresses. Foreign and Canadian subscriptions require extra postage and rate must be obtained by correspondence. Subscriptions may be either "New" or "Renewals" but it is important that this information be given in each case.

All orders must include a year's subscription to the CULTIVATOR. Write plainly all names and addresses to avoid error, and send all orders to the Cultivator Publishing Co., 115 No. Broadway, Los Angeles.

## Contents

THE AUTOMOBILE PROVES ITS VALUE TO FARMERS, Cover.

TEACH CO-OPERATION, 483.

CITRUS AND SUB-TROPICAL FRUITS.—Don't Ship Green Oranges; Impressions Relative to Avocado Culture; Papaya Juice, 484, 485.

DECIDUOUS.—Protecting Trees From Rabbits; Fruit Buds and Frost; Fruit in the Diet; Nut Growers' Convention, 486, 487.

SMALL FRUITS AND VEGETABLES.—The Spider is a Benefit, 488.

ORNAMENTAL GARDEN.—Financial Advantage From Tree Planting; Tulips, 489.

FORESTRY AND IRRIGATION.—Teaching Need of Forestry; How Hardwoods Decay; Heavy Drains on Nations's Forests, 490, 492.

BEES AND THEIR CARE.—How to Buy Bees; Hot or Cold Uncapping Knives; A Necessity, 493.

EDITORIAL.—Notice to Subscribers; Protection From Pests; Farmers Institutes; Yuma Lands; Irrigation Committee; Culls Selling for Big Prices; Lemon Rate; "Figgers Don't Lie"; Settled a Lawsuit, 494.

AGRICULTURAL NOTES OF THE PACIFIC COAST. Northern, Central, Southern, The Coast, 495.

LIVESTOCK AND DAIRY.—The Pest of Bermuda; Wear of Horse Shoes; Effect of Machine Milking on Individual Cows; Purebred Holstein Defined; Milch Goats; The Fly Nuisance; How to Free Cattle and Pastures of Ticks, 496, 497, 498.

PROFIT IN THE POULTRY YARD.—Starting in the Chicken Business; Diarrhoea; Ticks; Painting and Fattening; Age of Fowls, 499, 500, 501.

QUERIES AND REPLIES.—Rhubarb Juice; Transplanting Roses; Cold Weather Walnuts; Root Knot; Green Manure; Johnson Grass; Asparagus; Oranges Blooming Out of Season; Self-Milking Prevented; Birds Eating Peas; Sorghum Eradicating Morning Glory; Eucalyptus From Cuttings; Family Orchard; Fertilizer for Walnuts; Turkestan Alfalfa; Squirrel Poison; 502, 503, 504.

HOUSEHOLD.—Thanksgiving; Thanksgiving Dinner; Thanksgiving Table; Good Taste in Veils; Curing Cold in Advance; Dandruff Remedy, 505, 506, 508.

GENERAL AGRICULTURE.—Dodder in Alfalfa Seed; Climate of Alaska, 509.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 510, 511.

## Notice to Subscribers.

OUR PATRONS are warned against paying money for the Cultivator to one C. W. or C. N. McDonald. He has been operating in the Imperial Valley and may show up in other sections of the state. A reward will be paid for information that will lead to his arrest and conviction. He has never been employed by this paper and is simply a thief.

All our authorized agents have letters and other evidences of their right to receive money, and these will be shown on request. Demand it if there is any reason to suspect crookedness.

## Protection from Pests.

THE FRUIT GROWERS of Porterville have fallen into line and organized a protective league in order to insure their orchards against the encroachments of insect pests. In fact, the league is organized to have oversight over the welfare of the entire fruit growing industry, but the motive for the organization is the possibility of fruit tree pests being introduced. The community has made a strenuous fight for several months against the bringing in of lemons or other infested fruit from other sections.

Lindsay has perfected a similar organization and several citrus growing sections of the south took such action months ago. The purpose of the league is not in any sense to touch market questions, merely to protect orchards. An initiation fee of one dollar is charged, then a further payment of five cents per acre upon all acreage represented in the membership is required as a fund to aid in the work of the organization. One feature which calls for action by the Porterville league is the fact that the new horticultural law in providing a wage of $3.50 for the office of horticultural inspector, made no provision whatever for the expense of going from orchard to orchard and from one community to another. The Porterville growers will meet this difficulty and supply inspectors of that county with expense funds.

## Irrigation Committee.

THE SENATE COMMITTEE on Irrigation has made its tour of the state, entering California on November 6th, visiting Lake Tahoe, Orland, Sacramento Valley, Red Bluff, and Imperial Valley, leaving the state at Yuma. The Committee apparently was out for business and did but little stopping at the larger centers. At Los Angeles the train only halted, being late in arriving, so that only one or two members of the Committee were seen. The Committee consists of Senators Carter, Jones and Warren, and was accompanied by Director F. H. Newell and Chief Engineer Davis of the Reclamation Service.

## Culls Selling for Big Prices.

AT THE PLACER COUNTY fruit growers meeting at Loomis recently the remark was made that grade of fruit did not control the price, for several growers have sent culls to market and received for them much more than for extra fancy fruit shipped at almost the same time. The feeling is very common among fruit growers, and we know of particular instances which tend to confirm such a belief. For example, some years since after a heavy windstorm had blown many oranges off the trees, the fruit, immature and injured by the buffetings of the wind, was sent to market and brought larger returns to the growers than any shipment made later in the season. Of course there were circumstances such as bare market, desire to secure early fruit, and possibly other factors which combined to unload these oranges upon a retailer who may have suffered severely in his efforts to dispose of them, and this left such a bad taste in his mouth that it resulted, or at least aided in a poor market for the entire remaining season. Often, as was mentioned in the Loomis meeting, a packer will have desperate need of a few more boxes to fill a car for an order and will offer a high grade price for anything that will fill up.

Let not the grower for a moment believe that his low-grade fruit will, year in and year out, command anything but a low grade price. The incidents mentioned are no proof to the contrary. The grower who will conscientiously produce high-grade fruit and then insist on a high-grade shipper giving him a living price for it, will in the end win out, and should not be discouraged by the fact that his neighbor's indifferent methods have been unduly rewarded.

## Lemon Rate.

THE DETERMINATION of the railroads to take advantage of the increased tariff on lemons and take to themselves the profits, has stirred up not only the lemon men, but the entire country. The most active and effective opposition has been manifested by the Citrus Protective League, an organization of practically all the citrus growers of California brought into being to handle just exactly such a situation. This league has taken the matter into the United States Circuit Court and has secured a temporary restraining order against a slight advance in local freight rates to certain points of the Northwest. The more general advance in the freight tariff is scheduled to take place on December 6th, but that, together with the local Northwestern rate, will be discussed and probably decided on November 22nd, which date is set for the hearing. The docket is so full that it is not absolutely certain that it can be heard at that time, and if that is the case, a restraining order may possibly be secured on the more general advance of fifteen cents per hundred over the entire East.

## "Figgers Don't Lie."

THE PRESS of the state seems to be having much merriment at the expense of the Santa Fe Railroad Company which has been distributing a booklet of "valuable information" to its patrons coming from the East. It contains some statements that are so absolutely raw that it appears the newspapers are amply justified in their sport. One item states that the real estate valuation of Los Angeles county is $3,997,729.17. Such papers as are located in that county are anxious to have these figures presented to the state board of equalization. Another Los Angeles county item pertaining more particularly to agriculture is that there are some 65,000 tons of wheat, barley and corn produced in that county at a valuation of over $15,000. This is at the rate of about twenty-five cents per ton, which the farmers feel is not quite sufficient. Orange county is another liberal feeder of the Santa Fe lines. It is given credit for having a real estate valuation of $175,000. The publication is slightly more generous to Santa Barbara county, giving it a valuation of more than six times that of Los Angeles and Orange counties combined. San Bernardino has a set-back, being credited with $206,911.65. We suppose the sixty-five cents was put in for good measure. That county also produces over 53,000 tons of alfalfa to the value of $7,750 or fourteen cents a ton.

These interesting items are only a starter, as there are a large number of equally as absurd figures given in the book.

## Farmers' Institutes.

J. B. NEFF, Director of Institutes for Southern California, reports dates as follows: Calexico Nov. 29, Holtville Nov. 30, El Centro Dec. 1 and 2, Imperial Dec. 3, Brawley Dec. 4, Coachella Dec. 6. Other institutes with dates not definitely settled, but probably the week of Dec. 13 to 20, will be held at Arlington, Bloomington, Colton, Beaumont and Banning. A special bee keepers' institute is being arranged for Santa Paula on Dec. 22 and 23. Possibly another, devoted largely to apiculture, may be held at Colton Dec. 28 and 29.

## Yuma Lands.

THE CULTIVATOR recently made editorial mention of the opening to entry of the Yuma Indian Reservation and gave the date as early in January. The item was taken from a Yuma paper which is so close to the allotment that we took it for granted it had the information at first hand, but the editorial brought so many queries to the office that we took the matter up with the Department at Washington and have received word from the Commissioner of the General Land Office in effect:

"As to the opening of the Yuma lands in California and Arizona, you are informed that neither time nor method of opening same has yet been determined, and application for registration cannot be received at this time. Ample public notice will be given of time and method under which these lands may be entered."

The Cultivator Clubbing list on Page 493 this issue.

Neither the farmers nor their hired hands can work through combinations as readily as the capitalists or wageworkers of cities can work. It must not be understood from this that there has been no change in farming and farm life. The contrary is the case. There has been much change, much progress. The granges and similar organizations, the farmers' institutes and all the agencies which promote intelligent co-operation and give opportunity for social and intellectual intercourse among the farmers, have played a large part in raising the level of life and work in the country districts.—Theodore Roosevelt.

# Agricultural News Notes of the Pacific Coast

## Northern California

Contra Costa County grows about 1800 acres of celery.

The alfalfa grinding mill is now assured for Gridley, Butte county.

Growers of alfalfa hay over the valley report a very satisfactory season.

Alta, Placer county, is shipping some fine mountain apples to eastern markets.

The sugar company with plant located near Hamilton City, has leased 900 acres near Chico.

Butte county's output of oranges is showing up well and it is evident that it will be the bumper crop.

Marysville turkey growers expect about twenty cents per pound for live turkeys for the Thanksgiving trade.

Dickson has incorporated a $75,000 company which will plant large acreage to alfalfa and establish dairies.

Twelve acres of alfalfa near Ball's Ferry, Shasta county, produced 105 tons of baled hay. The land is unirrigated.

Butte county is to maintain an extensive and attractive exhibit of her products in the Ferry Building in San Francisco.

Penryn farmers have formed a local of the farmers union. Marion R. Struble is President and F. J. Gibson, Secretary.

The special demonstration train supplied by the Southern Pacific and the University of California lecturers, will tour the Sacramento Valley next week.

The Senate Irrigation Committee made thorough inspection of the Orland Irrigation Project and spoke highly of it, but thought the expense of establishment would be very great.

A petition was presented to the board of supervisors of Sutter county for the formation of a new reclamation district comprising lands of the Rideout Ranch and the Central Ranch.

The Gridley creamery is encouraging farmers in the owning of higher grade cows by buying extra fine stock and introducing and selling to the patrons of the creamery on advantageous terms.

A body of about 60,000 acres of land in southeastern Modoc county is suggested as a fine place for installation of an irrigation system and Salt Lake capitalists are contemplating the project.

While it is found a very expensive proposition to maintain the reclamation districts in Yolo county, the richness of that soil amply compensates and wonderful crops are the result of the combination of water and soil.

Fruit growers of Paradise, Butte county, have organized the Paradise Fruitgrowers Union. The union will be incorporated and be in a position next season to handle the fruit of its members. The directors for the first term are H. J. Bohannon, E. A. Hoag, C. A. Buckley, W. H. Ostrander and Mrs. F. W. Day, and Mr. Bohannon and Mr. Hoag, president and vice-president, respectively.

## Central California

Farmers Institute will be held at Madera November 23rd.

Turlock people now feel that they have assurance of a cannery.

Fresno county received the grand prize on its exhibit at the A-Y-P.

Raisins are still looking up and two and three quarters cents is expected.

One apiarist at Exeter shipped a carload of extracted honey to Chicago last week.

President Giffen reports that one season's tonnage of raisins has been sold since July.

Hindu orange pickers are flocking to Porterville and it is said have cut the price of picking.

It is reported that Tulare county will uproot 360 acres of peach trees and plant eucalyptus.

Dinuba raisin growers have quite extensively signed up with the new Central California Raisin Co.

Citrus growers in Kern county are alarmed at the discovery of red scale at Bakersfield, Kern and Delano.

One well near Delano, Kern county, has proved itself capable of producing eighty inches of water under pumping.

Peach orchards over the San Joáquin Valley are being sprayed with Bordeaux mixture to prevent attack of peach blight.

The valley was given its heaviest rainstorm of the season last week. It amounted to practically one inch in many sections.

Chas. S. Barrett, National President of the Farmers Co-operative and Educational Union attended the meeting of the state union in Fresno last week.

The Kingsburg Record reports that some fruit growers of that section who have consigned their fruit to the farmers union have received "red ink."

The tobacco farm located at Exeter, which it at one time appeared would be transferred to other sections, will continue to be the center of experiments in tobacco culture.

George C. Roeding's exhibit of choice olives made at the Seattle Exposition has been secured by the Union Pacific Railroad and will be used for advertising Fresno county in Eastern cities.

The citrus growers of Tulare county have formed a citrus protective league and the good work which has been maintained in that county will be still more strenuously followed out and the county kept free from pests.

Some apple growers at Watsonville have found that the New York agent's charge, together with custom house clearance, bills of lading, marine insurance, etc., are somewhat discouraging factors in sending fruit to London.

The chamber of commerce of Fresno has inaugurated a movement to procure the formation of a drainage district which will follow the lines laid down by government experts who have investigated the situation in Fresno county.

## Southern California

One farmer near Holtville Imperial county, has 1600 turkeys in one bunch.

The shortage of walnuts in the Southern California district will be about twenty-five per cent.

Every warehouse in Ventura county is full and groaning under the load of lima beans stored.

Orange county reaped a harvest in vegetables last year to the extent of about three million dollars.

It is rumored that the planting of cotton in the Imperial Valley next season will be very extensive.

Whittier cabbages are growing finely and it is thought the quality will be as fine as any ever grown.

A company with a capital of $100,000 has been formed to establish a denatured alcohol plant in the Imperial Valley.

The work of making the Santa Ana River more safe to agriculture is continued by cleaning the bed and building levees.

Orange county beet growers have contracted with the sugar factory for about 1,000 acres of beets to be grown next year.

An Orange county walnut grower makes the claim that walnut blight is not a bacterial disease but simply a climatic condition.

Improvements have been made in the olive works at Elsinore, San Diego county, and some pickling of the new crop has been done.

Oroville, Butte county, is now shipping heavily of early navels. The belief is expressed that this will be a banner year for the citrus section.

The Heber Fancy Melon Growers' Association has brought action against its secretary to turn over records and funds belonging to the association.

The record car of walnuts sold this season is said to be one of the Fullerton-Placentia Association, which contained about 600 sacks and brought $7,500.

The Riverside Press devotes a full page to illustrations of White Leghorn hens of Riverside. There are some exceptionally fine poultry ranches in that section.

Los Angeles olive buyers have offered Valley Center, San Diego county olive growers twenty dollars a ton in the orchards for oil olives and forty dollars for pickling.

The Imperial county farmers union has received its articles of incorporation, the president of the new organization being H. W. Morehouse and John McKinney is secretary.

The Santa Ana, Orange county, sugar factory closes its season's run this week. It has sliced about 45,000 tons and made about 6,000 tons of sugar. The beets averaged about nineteen per cent.

The manager of the Placentia Orange Growers Association has issued a circular to members showing the necessity of the groves being picked by the regular picking gangs of the association, and fruit hauled to the packing house on wagons supplied with springs.

## The Coast

The Yuma Irrigation project has cost the government $3,343,000.

A large number of cars of apples have been placed in cold storage at Seattle.

Big exhibits of Hood River apples are being made at the National Apple Show.

Today is being observed as Country Life Day at the National Apple Show at Spokane.

Yakima Valley potatoes are now quoted at Tacoma at fifteen and sixteen dollars a ton.

Farmers of Washington are greatly interested in the eradication of smut from wheat.

Yuma gave an enthusiastic reception to the Senate Committee which visited that place last Saturday.

At the territorial fair held at Phoenix last week, the noted pacer Dan Patch was driven against time.

Hood River apple growers made an exhibit of a carload of apples at the Irrigated Lands Exposition in Chicago.

The state college farm located at Pullman, Washington, is conducting a series of experiments with stock food.

The Hawaiian Experiment Station is investigating as to the worth of rubber trees as a commercial factor of that section..

Long Valley in the northeastern corner of Nevada is being populated as result of an extensive irrigation system just established.

Land at Midland, Southern Oregon, has just been cleared of sagebrush, which with irrigation, produced 100 bushels of oats per acre.

Over a thousand boxes of apples have been condemned by the horticultural inspector at Seattle because of being wormy or scaly.

White farmers lease from the Indians of the Nez Perce Reservation in Idaho lands for which they pay the Indians over $100,000 per year.

Experts in Washington claim that the state can be made to produce at least ten million bushels more wheat by the application of dry farming methods.

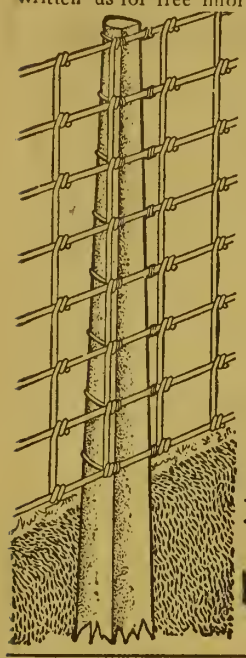
Apache Indians on the McDowell Reservation in Arizona delivered 1200 pounds of fine turkeys at Phoenix last week. They received seventeen cents a pound.

The Hawaiian Islands are finding that true success will come to the agriculture of that section only when greater development is made along irrigation lines.

The state officers of the executive committee of the Farmers Union of Washington held a secret session at Pullman last week and elected L. C. Crow, president, Palouse; A. D. Cross, secretary-treasurer, St. Andrews; J. Q. Adams, vice-president, Waterville, and Robert Brumblay, chaplain, Pullman. Members of the executive committee are: P. W. Cox, Colfax; Y. C. Mansfield, Endicott; H. H. McLean, Walla Walla; W. D. Davis, Lind, and E. Nelson, Nez Perce, Idaho.

# Everlasting

Don't think of putting up any more wooden fence posts till you have written us for free information as to how easy and cheap you can make solid, reinforced cement posts that can never *rot*, *burn* or *break*. You can make over 100 posts a day, and the material (cement wire and labor) will cost considerable *less* than wooden posts. Winter frosts do not effect the Everlasting.



## Mandt Stone Post Machine

The Mandt machine scientifically made of the best steel and iron, lasts a man a lifetime. No experience needed to operate it. We tell you how. Machine far more than pays in a short time for the reasonable price asked. We *guarantee* it successful or cash refunded.

Write us today for *Complete Information* on the interesting subject of cement posts. Learn the advantage and cheapness of durable posts with half-round backs and no holes in them and hundreds of other vital points. Complete instructions furnished with each Mandt Post Machine. Now is the time to make Cement Posts. Fall work is about over and posts can be made on days when you cannot work outside.

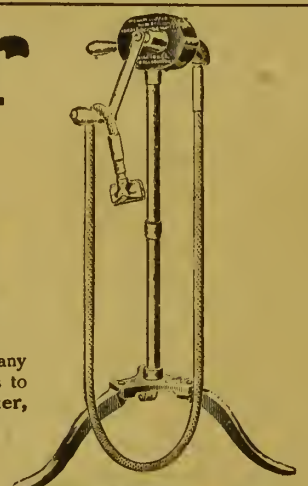
# Clip Your Horses Yourself



Stop paying high charges for work that you, or any man or boy, can do. There's no need to employ experts to clip your horses when you can clip them **yourself better, quicker, cleaner, safer and cheaper** with a

## Stewart No. 1 Ball Bearing Horse Clipping Machine

It's an economy for the man who owns one or more horses. For, with a STEWART, there are no delays. The machine is always ready for use. Horses can be clipped more frequently and at Regular Intervals. The STEWART is *the* machine that lasts indefinitely and gives good service *all* the time. It never requires attention, and runs practically without friction or wear. A tremendous speed of the knives is obtained by slowly turning the handle—and a boy can turn the handle. (Another boy can clip the horse.)

**Complete for $8.50.**

The price is for the machine ready to begin clipping horses with. It includes six feet of flexible shaft, the famous Stewart Clipping Knife and a liberal guarantee. Get one at your dealer's. If not there, write us.

## THE PEST OF BERMUDA.

By Mrs. M. E. Sherman.

THE Imperial Valley is thoroughly awake to the fact that Bermuda is a serious pest, and the people are holding meetings to devise ways of control.

One district has none of the grass while one company plans sowing it for stock feed. This is the occasion of the following resolutions and Mrs. Sherman's article.

* * *

Whereas: It has been called to the notice of the Horticultural Commission that valley lands are being seeded to Bermuda grass;

And Whereas; Bermuda grass is looked upon by a large majority of farmers as the worst pest in the valley today;

Resolved; That the partles sowing Bermuda grass seed be asked to suspend seeding pending further investigation looking toward the classification of Bermuda as a noxious weed.

I have noticed with interest the above resolutions passed by the Horticultural Board of Imperial county, condemning Bermuda grass. I hope they will be able to keep this grass out of these new districts not yet infected. It is a pest in the vineyard and orchards where it grows too fast for the lazy man's comfort. It has been planted on some lands in the San Joaquin Valley that were worthless from the rising of alkali owing to lack of drainage. Bermuda is taking a deadly hold on California wherever the land is rich and moist. The best land is to its liking. Everywhere in the winter time its brownish yellow tinge is seen marring the green velvet of the lawns. I notice each year the increase is very marked in the lawns of the parks and private houses.

Bermuda is a summer or warm weather grass. Cool weather checks its growth. Wherever there are frosts it may be controlled by turning the sods up on edge to the weather and after the action has been enough to kill most of it, raking it out and burning it up. I fancy, however, much we may try to control Bermuda it is like poor relations, it has come to stay in the cultivated lands, I have tried to spray it with various sprays, arsenic, lime and sulphur, blue stone and sulphate of iron, but it does not mind them greatly. The tops are deadened for the time, but it soon comes on with the persistence of bad habits, and it stays at it all the time. Crude oil alone has held it down on the ditch banks. I think the ditch company by using crude oil could keep it from spreading over the cultivated lands.

In the cultivated field the spots of Bermuda are run over with a sharp plow and cut into narrow furrows not more than two or three inches wide. Then the land is crossed with the disks. Then a long toothed harrow follows. The harrow is really used as a rake and as soon as the teeth are full, it is turned over and cleaned, the pile being made carefully and as soon as possible burned. The harrow and disks are run as long as any grass can be raked up. Then the ground is plowed, harrowed and a stiff seeding of grain put on it. After the grain is harvested, it is again looked over carefully and if any spots are found, the disking and harrowing is repeated until all traces are gone. The land is planted elther to vegetables or to corn crop the next summer and the Bermuda is watched for in the fall and treated if it appears.

This treatment is successful if the men are faithful to their duties. The owner, however, had better be on deck most of the time to see that they have not neglected the cleaning and burning of all the caked up grass.

Bermuda is a wonderful feed after all. The old lady sald that even the devil himself could be credited with the fact that he was not lazy. So it is with Bermuda. As soon as the summer sun comes warm and bright the bermuda grass is up and growing. The horses and young cattle keep fat on it. Three to four head to the acre are required to keep ahead of it on moist rich land. I have had 31 head of stock on a field of 17 acres for the past six weeks and today the wise man of the ranch tells me I should put all the colts out there as that bermuda is a foot long in places and the frost will take it before the stock get it eaten up clean. As a butter or milk feed Bermuda makes a poor showing compared to alfalfa. It will crowd out any alfalfa field if the land is at all moist. I would say to the friends in Imperial Valley, "Fight it and keep it out if possible." Ten feet of Bermuda grass scattered in a field will cover a hundred acres in five years with dense sod if not given regular and systematic care in its suppression.

### Johnson Grass.

This ls another pest against which the law has never been enforced. All along the ditches it is seeding the lands until many vineyardists prefer to sink wells and pump the water required for irrigation, rather than risk the seeding of the land to Johnson grass. It is easier to handle than Bermuda, however. It needs to be suppressed constantly by keeping the weed knives keen on the edges and cutting it off below the surface of the earth every two weeks during one whole summer. This will end its life almost without fail in one year's time. The test of thoroughness in the work is interesting to note. The Swedes and Germans on the ranches do kill out Johnson in one season—while the Americans usually put in two or even three at it. Patient and untiring well doing are needed on the farm as much as in any other walk of life.—M. E. Sherman.

---

Petitions are being presented to the state engineer by owners of ranches along the Russian River, asking that steps be taken to survey the river to the end that dredging may do away with injury to lands during time of flood.

### WEAR OF HORSE SHOES.

Probably there is not a fault of the horse—for fault it is—so common as the irregularity in the wearing of his shoes. It may be taken for granted that not 10 per cent. of horses wear their shoes exactly level. Under these circumstances, therefore, the average horse is bound to have swollen or puffed ankles. Any one can see that wearing a shoe in this manner forces an extra strain on the lower ligaments and ankle joints—yes, and other joints as well. This strain is bound to show its effects in the puffed ankle. Again, inequality of wear in the shoe is apt to, and often does, cause corn, quarter cracks, knuckling and such ailments. The reason for the first two troubles is that the extra strain thrown on the inner part of the hoof is too much for it to stand, and as a result of this unequal bearing and pressure the trouble is made to appear. In knuckling the trouble is forced by a weakness which is aggravated by the high inside heel and low outside, a complete and distinct inequality.

In the shoe for a draught horse, with which the trouble is most generally seen, much can be done towards remedying the evil mentioned. The toe calk is placed to protrude fully one-half inch to the outside of the shoe, and a strong side web at the heel with a stout calk attached serves as a lever against an outside roll and forces the foot to take a position on the ground more even than otherwise.

In placing this calk on the toe it should be remembered that only to a small extent should the inside part of the shoe have any of its bracing, the aim being to cause a different center line over which the toe shall break than formerly.

It is practically to the toe part that attention must be given, for it is there where the major part of the trouble is. The foot is placed on the ground, the first part to touch being the outside toe and the last to leave is the same. So we must, in order to find a new breaking-over line, make it troublesome for the horse to carry his foot in such a manner, and by placing all the wearing surface to the outside, naturally compel the foot to bear harder to the inside. It must also be borne in mind that the complete remedy for this evil is not found in one or two shoeings, but it must be kept up until the muscles, which have been allowed such freedom in causing the foot to work on an unequal line, are settled somewhat, and other muscles are set to work to perform duties which they have been, to a certain extent, free from; for it is through an unequal distribution of muscular activity that such irregularities occur.

As to the wear of horseshoes, I would remark that a horse will go in its natural way. The best way of finding out how to shoe a horse is to let him go barefoot until he has worn his feet into their natural shape—probably quite a different one to that which the average blacksmith tries to produce—then put a shoe on that fits the foot—W. R. Gilbert in the Horse Review.

### EFFECT OF MACHINE MILKING ON INDIVIDUAL COWS.

Owing to the rapid growth of the dairy industry in recent years and the increasing difficulty of securing competent help, much interest has been aroused in the possibility of securing greater economy in time and labor by the use of mechanical milkers. Several of the experiment stations, as well as the Dairy Division of this Department, have made experiments and published reports dealing with various phases of this subject.

At the Nebraska Station, A. L. Haecker and E. M. Little have been carrying on experiments for several years with a view to ascertaining definitely some of the practical limitations of the milking machine and the conditions under which it may be most successfully used. These experiments have dealt more particularly with the effect of the use of the milking machine upon the production of cows throughout the lactation period and the behavior of individual animals with reference to machine milking.

In the experiments 53 different cows have been milked by machinery. Of these cows some have been milked continually with the mechanical milkers from the time they were first tried, while others have been subjected to this method for only a short time. As a result, twenty practically complete lactation records have been obtained, together with numerous records covering shorter periods of time.

Judging Dairy Cows at Davis State Farm.

In 1908 an experiment with 10 heifers was begun which will cover a series of years. These animals have never been milked by hand, so their performance, as far as milking is concerned, will be entirely controlled by the milkers. So far, two lactation records by heifers have been obtained by machine milking which compare favorably with other 2-year-old records made in the University dairy. Heifers in their first lactation seem to give down their milk quite freely when milked by machine and are less inclined to hold up milk than are cows which have been accustomed to hand milking for several years before machine milking is begun.

In general it was found that the effect of the machine varied with the individual cows, and that some cows are not adapted to machine milking. Heifers in their first lactation apparently gave better results by machine milking than did aged cows that had been accustomed to hand milking for one or more years.

With animals adapted to the purpose, the use of the milking machine appears, according to the Nebraska Station experiments, to be of very decided advantage, but if there are several animals in the herd which can not be milked in this way to advantage the herd totals may be so lowered, and the resultant losses become so great, that they would not be compensated for by the saving of time and labor in the use of the machine.

The successful application of machine milking can not therefore be assured "until all the members of the herd are known to be adapted to this method of milking."—Experiment Station Record.

### PUREBRED HOLSTEIN DEFINED.

In some sections of Minnesota, and doubtless in other states, there are herds of Holstein-Friesians that have not been kept registered. The writer knows of several large herds from imported stock, owned by Hollanders, settling in Minnesota at an early date, who have not registered their animals, although they have been kept pure and breeding records made. Many herds owned by state institutions have not been kept registered. On August 4, 1909, at a meeting of the Board of Heads of State Institutions, it was decided to put their cows on record.

For this reason, there will be many who will wish to know just which animals are considered purebred and eligible to registration.

### MILCH GOATS.

C. A. Loud of San Diego is stocking up with some high-grade milch goats. Several weeks ago he purchased Rimu, a beautiful Red Alpine doe bred to Fable, a son of Prince Bismark, the noted Toggenburg. The purchase was made from the herd of Miss B. A. R. Stocker of Arroyo Grande and stock was so satisfactory that he returned to secure from the same owner the buck Jubel, also a son of Prince Bismark, the latter being nine-sixteenths Toggenburg and seven-sixteenths Saanen, the two highest grades of milch goats.

### THE FLY NUISANCE.

'O Lord! how foolishly helpless we are," ought to be the daily prayer or rather confession of thousands of farmers who allow their cows to be fairly eaten alive with horn flies and other flies, and never make an effort to help the poor animals. Since the advent of the small Texas, or horn fly, this trouble and loss has increased many fold. It takes only about ten or fifteen minutes for a man to spray a herd of 25 cows each morning and then the animals are comfortable all the day long. This applies to young calves very distinctly. The cost is trifling compared to the losses in milk that the torment causes. Why should so many of us be so helpless?—Hoard's Dairyman.

# SIMPLE

The only piece inside Sharples Dairy Tubular bowls.

Manufacturers of common cream separators put 40 to 60 disks, or even worse contrivances, into an old-style bowl and call it simple and modern. The 52 disks shown on the sticks below are all from one such bowl. These contraptions must all be washed twice daily.

But Sharples Dairy Tubular bowls have nothing inside except the tiny, instantly removable piece shown above on the thumb. And Tubulars are out-skim, out-last and out-class all other separators. That is because Tubulars are different—are the only simple, sanitary, modern separators made—are the World's Best.

52 Disks from one Common Bowl.

World's biggest separator factory. Branch factories in Canada and Germany. Oldest separator concern in America. Sales exceed most, if not all, others combined. Tubulars probably replace more common separators each year than any maker of such machines sells.

## HOW TO FREE CATTLE AND PASTURES OF TICKS.

THERE are four practical methods that may be employed in freeing cattle and pastures of Texas fever ticks: (1) picking or brushing off the ticks; (2) smearing or spraying the animals with a disinfecting solution; (3) dipping the "ticky" animals in a vat containing a solution capable of killing the ticks without injury to the cattle; (4) a systematic pasture rotation whereby the ticks are eliminated by changing tbe cattle to one pasture from another, allowing the ticks to drop off, and preventing new ticks from getting on the cattle.

In sections where there are large herds and ranches, dipping or spraying on a large scale has been successfully carried out, either alone or in conjunction with pasture rotation, while in other sections, where the cattle on farms consist of only a few head, hand dressing with oil has been found to be the most practical plan. The methods above suggested, therefore, apply to different sections of the country, and the stockman or farmer should select the one which is best suited to his particular case.

### Picking or Brushing Off the Ticks.

Where the herd is small the ticks may be picked off by hand or scraped off with a dull knife or currycomb. This should be done at least three times a week in order to remove all tbe large ticks before they mature and fall off, as by this system the smaller ticks which at first escape detection will be found before they are fully developed. After removal the ticks should be destroyed, preferably by burning. Care should be taken to go over the animals thoroughly, and after once going over they should not be neglected, as ticks may be picked up from time to time. If this work is thoroughly done and no ticks allowed to fall off and lay eggs from June 1 to the end of November, the cattle will be free from ticks and the pastures clean.

### Smearing or Spraying.

Greasing the animals all over thoroughly with cotton-seed oil, fish oil, or Beaumont crude petroleum will assist in preventing the ticks from getting upon them and destroy the ticks already on them. This method is practicable when only a few animals are to be treated. A mixture of 1 gallon of kerosene, 1 gallon of cotton-seed oil, and 1 pound of sulphur has proved effective when used two or three times a week during the tick season. It should be applied with a sponge, syringe, brush, mop, or broom.

Where a larger number of cattle are to be treated, but not enough to warrant building a vat, spraying has given good results. The necessary equipment consists of a force pump such as is used by orchardists for spraying trees, with a barrel in a wagon or on a platform and a hose with an ordinary nozzle. A 20 per cent. emulsion of Beaumont oil or a 5 per cent. solution of any of the standard coal-tar dips may be used. The sprayings should be continued throughout the whole season and if thoroughly done will leave the cattle and pastures free for the following year.

**Do your cows milk hard? Send 50 cents for teat expander. O., J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

### Dipping in a Vat.

Where a large number of animals are to be treated, dipping in a vat is a convenient and effective method. Beaumont crude petroleum is considered the most satisfactory dip and may be used either alone or in a 20 per cent. emulsion. Animals that have been dipped in the oil, especially during warm weather, should not be driven any great distance immediately afterwards, and should be provided with shade and an abundance of water.

### Pasture Rotation.

This system of eradication appeals to many farmers and should be followed wbenever practicable or conditions will permit. It consists in placing ticky animals in a small pasture for a period of 20 days. During that time a considerable number of ticks will drop off. Then transfer the cattle to a second small pasture for another 20 days, and if all of the ticks have not dropped off, to still another pasture. If the full time bas been used, 60 days will have been consumed and the stock is then ready to be placed on tick-free pasture. The object of moving the cattle from pasture to pasture at intervals of 20 days is to cause all the ticks to drop off and at the same time to prevent the animals from becoming infested again with young, or seed, ticks. Twenty days is less than the shortest time within which seed ticks will appear from eggs laid by ticks that drop off, and all of the ticks present on the animals will have dropped off in the 60 days. The young ticks, when hatched, will starve if no cattle are present in the pasture for tbem to get on.—From Circular of B. A. I.

## POTATOES AS STOCK FOOD.

Potatoes owe their food value principally to their high proportion of carbohydrates, which are found in potatoes in the form of starch.

They contain nearly three times tbe quantity of carbohydrates found in an equal weight of turnips.

Potatoes vary a good deal in composition not only as regards different varieties, but as regards the same variety grown in different soils.

Potatoes grown on strong soil contain more albuminoids than those from light land.

When they are of this composition they are firm when cooked and are said to "have a bone in them." These are the most nutritious class of potatoes.

Potatoes are more suitable for feeding pigs than for any other kind of stock.

Their high proportion of starch makes it necessary to mix them with food of a more albuminoid and fibrous character when given to cattle and horses.

Unless they are mixed with such food they are liable to produce colic; but when fed in proper mixture there is no more fattening food grown on the farm than potatoes.

When the potatoes are withdrawn, the cattle lose in condition at once and take some time to make it up again.

When potatoes are diseased, it is the albuminoids that decay. The starch remains unchanged, and if the decay has not gone too far, potatoes that are diseased may be used for stock feeding, but such potatoes should never be fed raw.

If a large number of potatoes are found to be touched with disease at lifting time they may be cooked, and if salted and packed firmly in barrels they will keep for some time if the air is excluded.

The flesh-producing quality of potatoes is destroyed in proportion as the disease has destroyed the albuminoids, but the carbohydrates are fully capable of performing their work of keeping up the animal heat and adding to the fat.—Farm World.

Several counties north of San Francisco Bay have united in fitting up a travelling car of exhibits showing in the East the productions of tbose counties.

## STARTING IN THE CHICKEN BUSINESS.

By Bee Josephine O'Mealey.

WHEN one has read all the catalogues and syndicate stuff the feather part of the brain can hold, and fully decides to embark in the chicken business, there are several ways to begin. One man I knew borrowed a broody hen and a setting of eggs from a neighbor, and the neighbor was parsimonious enough to insist on him returning the hen after her summer's work was done, and found fault because the hen was so poor she could hardly carry her feathers. As if one cared to feed a hen for somebody else! So, as fault-finding is an all too prevalent practice, I should not advise the beginner to borrow his start.

Rural debating societies for generations have argued, "Which came first, the chicken or the egg?" Not being versed in ancient history I shall not offer an opinion on that subject, but simply suggest that it would be better for the eggs to come first, or rather about three days after a good incubator, three days being long enough to get acquainted with the workings of the machine before putting in the eggs.

### Incubators.

Some one asks: "What is a good make of incubator?" Most of them are, though some are better than others. I owned one well advertised machine which never hatched a chicken or duck out of perhaps a thousand eggs entrusted to it, and cared for assiduously, and another even more glowingly advertised never brought out over 25 per cent of the fertile eggs. It is not in my province to recommend any particular make of machine, but the best one I ever saw was made here in our own state. Bear in mind, however, that no machine ever was or ever will be made which will hatch infertile eggs. Most incubators, if intelligently cared for, will hatch a good percentage of the eggs with good strong germs. And an incubator is much more satisfactory than a hen, for it has no idiosyncrasies, never changes its mind, never kicks eggs to pieces, never tramples the chicks—and has no bugs.

I should not advise a beginner to purchase larger than 120-egg machine and a 50 or 60 egg is better. Fifty chicks is the utmost limit of one brood for an inexperienced person to handle, and after one has acquired experience the wisdom of small flocks is fully apparent. Two or three small machines will cost little if any more than one large one, and be infinitely better. Some poultry raisers have two sizes of incubators, say 50 and 100 egg, and set both at once, then on testing out the infertile eggs there will usually be about enough to fill the larger machine to full capacity. Bear in mind that the manufacturer knows the powers and capabilities of his machine, and that he never neglects to claim for it all that it will do, so do not put 120 eggs in a 100 egg machine by the expedient of standing them on end as did a woman of my acquaintance. At the end of three weeks she had some experience, but no chicks.

Do not fail to test out the eggs as soon as you can safely do so, which will be in five to ten days, varying with the kind of eggs and the experience of the operator. The infertile eggs make fine food for chicks, and may be saved until the hatch comes off; for understand, an infertile egg never becomes fit to enter politics, it dries up, but never rots.

Indeed many people would rather buy them for cooking purposes than storage eggs, and I have sold many a dozen at a reduced price; the purchaser understanding clearly just what the eggs really were.

The incubator must stand solidly on a firm floor, and out of draft, the lamp must be cleaned and filled and trimmed regularly, and while the manufacturers of today have the regulator system down almost to perfection, a watchful eye on the thermometer is no drawback. I usually turn the lamp up a trifle in the small hours of the late night, for then the temperature usually falls a little.

Do not neglect to cool and air the eggs and do not omit the turning. A hen—and after all I suppose she does understand incubation best, though it seems that when she has laid the eggs her duty is done—turns and shifts her eggs many, many times in twenty-four hours until they are polished with the friction.

At least a week before the eggs are due to hatch—and this takes three weeks—get your brooder ready. It can wait for its occupants better than they can wait for it. A good brooder, and there are many on the market, costs but little, and is as necessary as an incubator. Chickens have been reared in boxes with jugs or cans of hot water to supply heat, and so have they been hatched in improvised incubators, but it is expensive economy.

The chicks sometimes begin to hatch as early as the seventeenth day and I prefer to see them all out by the end of the twentieth day; some will perhaps be later, but as a rule those slow to hatch are wanting in vigor. Contrary to the rules laid down by the manufacturers I prefer to remove the chicks to the brooder as fast as they dry off, and also take out the empty shells. An unusually lusty chap frequently inflicts not only annoyance, but serious injury on those struggling for exit from their prisons, and sometimes a half shell will wedge over another egg in such manner as to do harm.

### Care in Brooders.

The floor of the brooder should be covered an inch deep with some soft material which may be eaten without injury, such as bran, chaff or shatterings from hay. The book of directions will tell you the brooder should be 90 degrees to 95 degrees, but a thermometer in a brooder is a superfluity. As the old colored mammy told the young mother regarding the baby's bath: "Don't need none o' them fool mometer tings. Jas' poke the bressed lamb in, an' if its too hot

# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***

***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

## Petaluma Incubator Company

he'll turn red and if its too cole he'll turn blue." If the brooder is too hot the chicks stretch their necks and gasp, emitting a sharp sound, if too cold they huddle and trample each other to death, meanwhile giving vent to plantive wails of discomfort; whereas if just right, they scatter about comfortably and keep up a contented purring murmur and "sing themselves to sleep."

We once made a brooder to use in the house, and the top was composed of a glass door of an old refrigerator, thus affording a full view of all the inmates at any time one cared to look, and it was both pleasant and instructive to see how they expressed satisfaction in their attitudes.

The object in crowding together, is to obtain the coveted warmth, and if the crowding is continued the result is dead chicks, for the weaker will fall an be trampled to death. Temperature is more a vital question than food in the early stages of growth. A chick might far better get most uncomfortably hungry or most unreasonably over-fed than either too cold or too warm.

Either extreme of temperature is almost invariably followed by diarrhoea, that most fatal of all infantile complaints, human or otherwise. A chilled chick will "bake," that is through the weakness of the general system, the rectal muscles are not able to throw off the excretia in the proper manner, free of the body, a small portion remains on the skin just below the vent, and this is added to by each excretion until sometimes the accumulated mass of filth may be almost half as large as the chick itself. In this case the chick may be thoroughly greased, to soften the mass sufficiently to be removed, or it may be soaked off with warm water and the chick kept warm until it dries and is comfortable thereafter. This is a tiresome and unpleasant job, and the better way is to avoid it before it happens, as the effects of even a slight check in the growth and well-being of a chick are difficult to entirely eradicate and it is easier and more profitable to care for ten healthy, hearty chicks than two sickly stunted ones.

Vermin.

Of course if you have used an incubator for hatching purposes you need not look out for vermin for a few days, but if you have hatched with a hen the fight against this opposing army should begin at least three weeks before the eggs begin to hatch. Use grease sparingly on a setting hen, rather use some of the many good louse powders, or make one of equal parts of air-slacked lime and sulphur with a little carbolic acid added. Do not use fresh lime on a living creature as it is caustic in the extreme. A man of my acquaintance dusted a setting hen with fresh lime and twenty-four hours afterward was obliged in common humanity to kill the poor raw creature to put her out of her agony. A woman whom I knew once drenched a lousy hen thoroughly with kerosene, and nature came to its relief, for death relieved its sufferings in a few hours. Tobacco stems make an excellent nest material, as does also air slacked lime.

The chicks should be looked over carefully every two or three days for vermin. I have never found anything better than lard and sulphur with the addition of a few drops of carbolic acid and a little kerosene. Proportions are not essential so long as the oil and acid are not in sufficient quantities to burn the tender skin. This ointment should be applied under each wing and leg, around the neck and around the vent. A lone downy chick whose feathers are just sprouting was presented to a member of my family the other day, and I observed "Socrates" to have dark patches under the little wings which at a distance resembled dried blood. On examination he was found to have dozens of little blood-thirsty ticks absorbing all the nourishment of which he robs the cats at each meal. One application of lard and sulphur cleaned them off. There is something waiting to prey on everything and you need not think to embark in poultry raising successfully unless you have the eternal patience to keep everlastingly on the watch for the numberless accidents which we are told will happen in the best regulated families.

## POULTRY QUERIES.

Diarrhoea.

I have a number of little chicks which have diarrhoea, make a queer noise for a few days and finally droop and die. Can you tell me what to do for them?—Mrs. R. S.

It is hard to tell what has caused the diarrhoea, unless one knows what feed has been used, or how the chicks were hatched. If incubator hatched, I should suspect either too great heat, or their being chilled, either of which will cause the symptoms you describe in this way.

The digestive organs seem very sensitive in chicks which have been either overheated or chilled during incubation, and the yolk, which is their first meal, and answers the same purpose as the "colostrum" in the case of a young calf, does not dissolve, but "cakes" and hardens in the chick's intestines, thus causing its early death. A post-mortem should be made, and if this hard substance is found in the digestive tract, you may be sure what caused the trouble. Again, the food may be too rich, and in that case, a post-mortem would disclose a liver very dark and large, sometimes with white specks, or yellow specks all over it. A dose of castor oil would be of benefit in either case, but in the first, the only sure cure, would be to open the intestine and remove the undigested yolk, and it would be a very delicate operation, I think. I have known of cases of diarrhoea being cured with catnip tea, and have used it successfully myself, making a strong tea of the stems and leaves, and mixing the mash with it, using mostly bran, and they would greedily eat every stem and leaf.—Mrs. M.

Ticks.

How destroy a small flea-like insect that has appeared in my flocks of chickens for the first time this year?. It's not the mite, as I know it after 25 years experience, but red and flea-like and sticks to the combs and wattles, eyebrows, etc., much like a tick.—J. H. R., Oleander.

I am much afraid that this correspondent is up against one of the worst pests we have, which is chick ticks, and that his only way to get rid of them is to spray his houses and yards with a solution of corrosive sublimate, of course first removing the birds to other runs for a time, as this is a deadly poison. The way to use it is to dilute eight ounces of the corrosive sublimate with twenty gallons of water, and spray thoroughly with this. Now, in spraying, remember that a fine, mist like spray,

will not do at all, for the pests, like bedbugs, crawl into the inmost cracks and crannies of the buildings, between boards and where the shingles lap, and a strong stream must be directed into all parts of the building until the whole is saturated, inside and out. No economy of material will do effective work here, and it must be repeated in a week, and again and again until sure the pest is eradicated entirely.

For the affected birds, use one teaspoon of carbolic acid to one pint of water and wash their heads thoroughly, removing every tick carefully.

One lady reported success in ridding her house and yards of this pest by painting inside and out with crude petroleum in which she had mixed crude carbolic acid in a 2 per cent solution, for the houses, and sprinkling the yards with the same, anointing the chicken's heads with carbolized vaseline, and this has the advantage of not being poisonous, so the chickens need not be moved.—Mrs. M.

### Painting and Fattening.

I expect to raise about 300 White Leghorns. I will plant alfalfa in their pens; will that be enough green food or should they have a variety? Should the cockerels that are sold when they weigh about two pounds be fed differently from the pullets? And if so, what for each?

I have my brooder house painted inside and out with crude petroleum mixed with Red Venetian. Is that sufficient or should it be sprayed with distillate or emulsion as a mite preventive? I am going to build a hen house for the hens to roost in and lay in. Would you paint it with petroleum or spray it once a month? Would it be all right to paint it on the outside and spray it inside? How many cockerels should be kept together to fatten for market, and how much room should they have to exercise in?—R. B., Hanford.

The alfalfa, if fresh and tender, will be all right, but they will greatly relish fresh lettuce leaves, and other greens as a change. Feed cockerels and pullets the same up to the age for fattening. Painting outside is sufficient, as the monthly spraying must be done anyway. To fatten for market, small pens eighteen inches square are sometimes used by broiler plants, with slatted floors, placed in rows in a long building, high enough up so one need not stoop in feeding and watering. Six cockerels are fattened in each of these coops, the food being placed in troughs in front of the coops, and the place kept in semi-darkness only at feeding time. Ten days is all their livers will usually stand of this treatment, and if milk fed, they will fatten very nicely in this time.—Mrs. M.

### TELLING THE AGE OF FOWLS.

As a rule, people judge the age of a fowl by its spurs, but the length of spur is no positive criterion to go by. We have some cockerels that show more spur than do some of our cock birds. But, generally speaking, the size of spur will help out a doubt.

An Australian authority says that a pullet will show rose-colored veins on the surface of the skin, under the wings. There will also be long silky hairs growing there. After a year old those hairs disappear, as also do the veins, and the skin grows white and veinless. The difference can be seen at a glance.

Again, a pullet that has not laid, or has just commenced laying, will have the bones of the pelvis or basin almost touching. The bones gradually widen as the fowl continues laying, and at two years old are much farther apart than at one year old.

The third point of difference lies in the claws and shanks. In a young bird the skin of the claw is supple, and the scales thin and brilliant. The skin gets coarser and stronger, and the scales harder as the bird grows, and the nail of the last toe, which does most of the work when the bird scratches, gets much worn.

There is also a difference in the eyelids. These acquire wrinkles as the bird gets older, and there is also a slightly shriveled look on the face. This, with age, becomes more and more pronounced.

English authorities hold that there is no certain test of age. But they admit and endorse the experience of the writer, that, in general, the spurs both of hens and cocks will distinguish a two-year-old bird, but there are exceptions in which really young birds develop old-looking spurs, while really second-year birds preserve the short, rounded spurs of a cockerel.

The texture of the legs is a guide to some extent, and so are the delicacy and freshness of the skin of the face and comb; but still an occasional hen will preserve her youthful appearance to a startling degree.

The skin of the body is a better test, becoming coarser and drier looking with age.

Formerly the wing feathers were considered an absolute test as between a pullet and a hen, even after the long practice of early breeding had made the moulting of early pullets quite common.

To a certain extent, the absence of pullet-quills still is regarded as evidence of greater age, but for some time these feathers also have been becoming more and more uncertain as to the actual fact, unnaturally early hatching having upset all the old rules.

It is more difficult to judge the age of water fowls than of other poultry, partly from the absence of spurs, partly from greater longevity, and partly because the water keeps their legs soft and fresh.

Ducks waddle more heavily as they grow older, and after two or three years they acquire a depression down the breast.

An abdominal pouch of great size indicates great age in geese.

Turkeys up to a year old are said to have black feet, which grow pink up to three years of age, when they gradually turn gray and dull.

Age in pigeons is often told by the color of the breast. In squabs the flesh looks whitish as seen through the skin, but becomes more and more purplish as the bird grows older.—Farm World.

### WORTH WHILE.

"So you've been sitting on a dozen eggs for three weeks and only hatched out one offspring?" commented the rooster.

"Yes," replied the hen proudly, "but it was worth the trouble. That chicken has three legs."—Detroit Free Press.

Don't forget to lay in a lot of leaves for the hens to scratch in.

Keep plenty of lime on the dropboards; it will keep them dry.

**Out Door 1910 Style**

**Fireless Brooder Now Ready**

The best fireless brooder ever made at any price. Double walls, extra good heavy hover and board, rain, weather, rat and fool proof. Mistakes can't be made. # Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Rhubarb Juice.

Is the juice of rhubarb saleable? If so, please give all the information you can about the matter.—H. A. H., Greenfield.

We do not know of the article having a regular market. It is said to make good wine and vinegar. There was at one time a factory in contemplation at Pomona for the manufacture of vinegar from the juice. We do not know whether it ever operated or not.

### Transplanting Roses.

What months of the year should rose roots be lifted ,and can the tops be left on?—Subscriber, Calabasas.

The plants can best be transplanted when dormant. If water was withheld from them late in the summer and they are perfectly dormant, they may be transplanted at once. In fact, we have seen them taken up almost every month in the year. Ordinarily the winter dormant season is preferred. It is possible to leave a large part of the top, but we think you will find better results to remove largely of the old wood.

### Cold Weather Walnuts.

What variety of English walnuts is best adapted to cold weather? What kind will bear freezing in winter, and what bears fruit earliest, and at what time?—Subscriber, Calabasas.

If by cold weather is meant the mid-winter season when all are dormant, any variety will stand the climate of any fruit growing section of California, but if late spring frosts are considered, that is, at time of blossoming, then the later bloomers should be planted. The Mayette or Franquette, we believe, are preferred for such situations in the north. But at Calabases the soft shells grown in the south should prove satisfactory especially the Eureka variety. There are also a number of new varieties now being introduced in the northern part of the state which are succeeding well. Any grafted variety will bear within a very few years after planting. The grafts placed on large trees will bear a crop the second year from grafting.

### Root Knot.

I have almond trees that were set two years ago last spring. Many have died from crown gall. What can I put in their place? Will either apples or oranges grow in the same ground? Will digging these trees up and mixing a half bushel of wood ashes in the soil around each hole destroy the germs of the trouble so that I can plant other similar trees next spring?—T. J. F., Fair Oaks.

Either apples or oranges will do well on the same ground, but the mixing of wood ashes in the soil of each hole would not destroy the germs of the disease, and trouble would result from planting the same kind of trees.

### Green Manure.

To what extent will green manure obviate the necessity of other fertilizing of orange groves? Will alfalfa for green manure keep alive through the summer on sandy soil at Redlands? Is barnyard manure a complete fertilizer? Is one coat of it once in three years sufficient?—Subscriber, Redlands.

Unless the grove is in excellent condition, we should not lessen the regular fertilizing of the orchard for a few years at least until it was put in excellent condition by the humus gained from the green manure. In time it is possible that the nitrogen fertilizer might be dropped and only potash and phosphoric acid added. Alfalfa might possibly keep alive if unirrigated through the summer, but we do not think it would give the same value to the grove that would be given by clean cultivation followed by vetch or peas for winter growth.

Barnyard manure can hardly be considered a complete fertilizer. It contains abundance of nitrogen which can be supplied by the green manure crop, but it is not especially valuable in potash and phosphoric acid. One application in three years will not suffice if it is desired to keep your grove in excellent condition.

### Johnson Grass.

We have on our ranch plants called here "evergreen millet." It is evergreen and grows the year round without water. When it seeds it is about three feet high. Stock eat it greedily. I wish to know if it is desirable as a forage plant for milch cows.—Subscriber, San Bernardino.

This query with sample of grass was sent to the experiment station of the state university at Berkeley and Prof. Wickson writes:

"This is Johnson grass which is counted one of the worst pests ever introduced into the state because it is so hard of eradication from good lands which are desired for other purposes and because it will not grow in waste, dry places where it might be of some advantage. It has some feeding value, but this is no offset for its undesirable characters. By California state law, it is unlawful to grow it near division fences or irrigation ditches."

As will be noted in Prof. Wickson's answer, the state law calls for the immediate destruction of this grass in certain locations, and our subscriber will do well to prevent its spread, for it will take much valuable land within the next few years.

### Asparagus.

What is the best variety of asparagus for market garden in this part of California?—C. M., Arroyo Grande.

Palmetto or Conover Colossal are considered the favorites.

### Oranges Blooming Out of Season.

Kindly inform me of the cause of orange trees that have already put out every growth of the season and are now putting out heavy new growth with many blossoms.—Subscriber, Redlands.

The only explanation we can offer for this condition is that while the trees may have been in fairly good condition, a shortage of water may have resulted in the late summer season, when a heavy irrigation would start a fall growth and fall bloom. The orange tree is sensitive to being deprived of its proper amount of water in the growing season, and when it is supplied, endeavors to make good by stronger growth and out of season blooming. There may be other conditions which have caused this, but without more particulars, this would be our guess.

### Self Milking Prevented.

In your issue of October 28 Mrs. Sherman gives several methods for curing self milking cows. I have a cow on which I have tried them all. The only one that was of any use was the one with a stick between her front legs fastened to a surcingle. This ordinarily prevented her getting in her work, but frequently she would get herself into such extraordinary positions that she would succeed in reaching her udder, even sitting up on her haunches like a dog and doubling over. A neighbor told me of a canvas sack fastened to a kind of harness, surcingle crupper and hip

straps. I got one and put it on her and so far it has proved entirely satisfactory. In milking it is only necessary to loosen a snap on one side and drop the sack and the udder is always clean.—J. C. G., Modesto, Nov. 8.

### Birds Eating Peas.

In answer to query as to how to prevent birds from eating peas, we give another method that has been found effective.

Take baling wire or any other cheap wire and stretch along each row of peas on two foot stakes after they are driven into the ground. Cut strips of white paper one inch wide and three feet long and hang strips on the wires about every two feet. The wind will flutter the papers and frighten away the birds, rabbits and squirrels.—William Richard, Santa Cruz.

### Sorghum Eradicates Morning Glory.

In what issue did article appear regarding sorghum for killing out morning glory? Where can seed be obtained?—B. B., Blanco.

The article referred to was written by Mrs. Sherman and appeared in the Cultivator of October 21st on Page 402. The seed may be had of any seedsman advertising in the Cultivator.

### Eucalyptus From Cuttings.

Can I grow eucalyptus from cuttings. If so, what varieties —E. L., Carruthers.

A great many trees can be grown from cuttings which it is not practical to grow in that way. Plums and many other deciduous fruits and eucalyptus have been so grown. We do not know positively, but think almost all varieties of eucalypts may be. As to its being a practical method, we doubt it very much.

(Continued on Page 504.)

## MILCH GOATS.

In a September Cultivator an item relative to Swiss Milch Goats appeared in your columns that was misleading, I think. The item was:

"Five imported Swiss milch goats have recently arrived at the Wisconsin Experiment Station. These goats are of the breed known as Schwarzenburg-Guggesberger, a breed noted for its milk giving qualities. The object in making this importation is to experiment with the milch goat in this country, and compare their economy of milk production with that of cattle.

The inference would be that it is now possible to import milch goats from continental Europe. For several years the U. S. Government has had a strict quarantine placed on the importation of milch goats and but for the fortunate fact that a few small importations were made prior to this action on the part of the government, we would have in this country nothing as a nucleus from which to build up a herd of these wonderful breeds.

The five goats mentioned in my quotation are the property of Mr. Ernest Gonzenbach, vice-president of the Sheboygan Light & Power Co. and Mr. Gonzenbach, in a letter to Mr. Winthrop Howland, of Redlands, stated he had loaned his goats to the University of Wisconsin for experimental purposes. They are in charge of Prof. Geo. C. Humphrey of the Department of Animal Husbandry.

Mr. Ganzenbach is a native born Swiss and imported these goats of the Schwarzenburg-Guggesberger breed several years ago, thinking they would better endure the severe winters of Wisconsin than some other breeds. So far as I know, the only pure bred doe of this breed in California is now owned by Howland & Hurd of Redlands. It is doubtful however if any breed will ever equal results produced by the Toggenberg. —Q. A. Lobingier.

## INCUBATOR FACTORY BURNED.

The offices of the Petaluma Incubator Co., and a part of its storage rooms were burned on Nov. 4th. The factory remains in operation, and Mr. Gray, Manager of the company, writes that it is prepared to operate day and night so that orders may be filled at once. The cause of the fire is as yet unknown, but as the night watchman was found dead on the premises, and other suspicious circumstances were disclosed, the coroner's jury rendered a verdict of murder, and it is assumed that the factory was fired by incendiaries. The company carried a liberal insurance, but it is understood that it will fall several thousand dollars short of the actual loss. Regarding the combustibility of Petaluma incubators, Mr. Gray writes:

The condition of the "Petaluma" Incubators and Brooders that were thrown out by the carload into the street below has proven that our construction of these goods is a resistant of fire. Redwood is hard to burn. It will char, after which it is not easy to ignite. Our wool insulation does not blaze but will smolder. This has protected the inner jute-board lining so that many of the incubators and brooders are hardly discolored from the heat internally. In fact, those that have not been broken and chopped into by the firemen, would do as good work in hatching as if this fire had not occurred.

# Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

### HORTICULTURAL PRINTING.

THE KRUCKEBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

### FERTILIZERS.

SULPHATE OF POTASH
$60.00 per ton.
For a short time we will sell Sulphate of Potash at $60.00 per ton.
This is the right time to apply it for maturing the crop and the new growth of wood.
This price won't last. Get your supply now from the Armour agent in your district.
THE ARMOUR FERTILIZER WORKS, Los Angeles and Colton.

### HONEY.

SAGE HONEY, GUARANTEED ABSOlutely pure. One 5 gal. can, crated, f.o.b., $4.25, two 5 gal. cans, crated, f.o.b., $8.00. HENRY E. HORN. Riverside, Cal.

### RHUBARB.

CHOICE CRIMSON WINTER RHUbarb and Conover Asparagus one-year plants, from selected seed, for sale in large orders at a little over cost of digging expenses. Write for particulars. W. B. CURRIER, Sea Bright (Suburb of Santa Cruz,) Cal.

### HOGS.

BERKSHIRE PIGS—PERFECT TYPE, popular American strains. A few choice boars and sows. Herd Boar, Kingsclere Duke 111812. G. B. REEVES, Mountain View, Cal.

### Family Orchard.

Please advise me as to different varieties of fruits for family orchard. Have good soil, sloping south, and pumping plant. Would prefer such fruits as apples, pears, peaches, apricots, plums, etc., also berries. Have raised alfalfa successfully for twelve years in northwestern Nebraska. There I found barnyard manure gave excellent results. I have some fifty loads on hand. Will it be advisable to place it on alfalfa?—J. E. T., Chino.

In planting fruits for a family orchard we would make a special effort to grow small fruits and others that cannot be satisfactorily purchased in the market, that is, the soft fruits like figs, and even peaches which bought on the market are often picked green, hence not of high quality. We recently saw where a farmer with only a small portion of land given to family orchard was growing several soft shell walnuts. Such trees require a great amount of space and the product is no more satisfactory than can be procured on the market. We would plant figs, probably not to exceed one or two trees, one black and one of the small Smyrna fig. If one has plenty of room, more might be planted, but these two trees will supply several families with fruit. Peaches should be planted in variety so as to begin bearing in June and carry through till late October. Apples we would plant sparingly, for the same reason that we would not plant walnuts. However, the early summer apples would do well at Chino, and if desired, one or two of the winter varieties might be planted, but we should prefer to buy them from a section better adapted to winter apple growing. Bartlett, and possibly Winter Nelis pears would be about all you would care to have. With plums, we would like to have several trees, the cherry plum, French prune, sugar prune, Wickson and possibly a Kelsey.

As to these fruits, your neighbors can give you more explicit information as to varieties which have done best in that locality. Of berries, we would have Cuthbert and Rochelle raspberries, dewberries and a good mammoth blackberry, strawberries in variety. Two or three beds of strawberries, by withholding and giving water at proper season, will give you fruit the year through.

It would be a good plan to write to the various nurserymen advertising in the Cultivator for their catalogues. These give the good points of the different varieties and their time of bearing and from these you can make out a list which will suit your own fancy better than can be done by one who does not know your needs.

By all means apply all the fertilizer you can get.

### Fertilizer for Walnuts.

Would you recommend commercial fertilizer for walnut orchard eighteen years old? It had an application of two tons of superphosphate two years ago. No other commercial fertilizer has ever been used on it, but it has had bean straw and some manure for the last five years. The orchard bears seven or eight tons per year. Would it do to use potash or nitrate of soda? What time of the year should it be put on? The nuts are soft shell. Would you advise vetch?—G. L. A., Fillmore.

As the inquirer does not give the number of trees bearing the seven or eight tons it is impossible to know whether the orchard is up to its capacity or not but it is a fact that orchards with greatest amount of fertilizer and in best tilth produce most profitably, and this one has only been fertilized once in eighteen years with commercial fertilizer and possibly not very heavily with stable manure. We would recommend, without knowing more of the particulars, that the ground be thoroughly irrigated and cultivated at once to make good seed bed for vetch, adding superphosphate or a complete fertilizer to give the vetch seed plenty of available plant food at once to make a good growth. Drill in the seed at the rate of 40 pounds to the acre, and then furrow so as to irrigate should the rains not be sufficient during the winter season. Keep growing the winter through till February or March, but be sure to plow under before the ground gets too dry. Put under deeply, at the same time giving an application of superphosphate. Continue the application of all the stable manure possible to secure.

### Turkestan Alfalfa.

Where can I purchase Turkestan alfalfa seed?—Subscriber, Arroyo Grande.

This plant has not proven satisfactory to the extent that seedsmen generally carry it. However, any seedsman advertising in the Cultivator will get it for you. We cannot see wherein one would like that particular variety in the Arroyo Grande section, for we believe that the common or Chilean variety would prove far more satisfactory. Possibly the subscriber is thinking of the Arabian which has proven in many sections of the state more satisfactory than the ordinary alfalfa. The seed for it cannot be had at the present time, but the government importation is expected to arrive in December, when it will be placed in the hands of several distributors in different parts of the state. As soon as announcement is definitely made as to who the distributors will be, the names will be given in the Cultivator.

### Squirrel Poison.

What is the proportion of strychnine, saccharine and white of egg used to poison squirrels?—Subscriber, Vacaville.

We have no formula containing white of egg, but if subscriber will refer to issue of May 20th, Page 589, he will find two good formulas.

### CLOTHES-CLEANING COMPOUND.

Such a compound may have the following composition:

| | |
|---|---|
| White Castile Soap | 90 grn. |
| Alcohol | 4 dr. |
| Glycerin | 1 fl. oz. |
| Ammonia Water | 1 fl. oz |
| Ether | 1 fl. oz. |
| Water | to make 16 fl. oz. |

Add 3 dr. of this mixture to a 4-oz. bottle, and add benzin, a little at a time, shaking thoroughly after each addition, until bottle is full; the result will be a thick white cream.—Merck's Drug Report.

### ETCHING SIGNS ON GLASS.

The following process has been recommended for this purpose:

| | | |
|---|---|---|
| a—Sodium Fluoride | | 9 dr. |
| | Pottassium Sulphate | 110 grn. |
| | Water | 1 pint |
| b—Zinc Chloride | | 215 grn. |
| | Conc. Hydrochloric Acid | 10 fl. dr. |
| | Water | 1 pint |

Equal parts of solution a and b are mixed in a rubber or other suitable dish and applied to the cleaned glass with a rubber pencil or brush.—Merck's Report.

# Household Department

## THANKSGIVING.

THANKSGIVING is a day of American origin. When the Pilgrim fathers came to America they sought freedom from religious persecution. The fall of 1621 found them much reduced in numbers but the spirit of those living was undaunted. They had had fairly good crops and the Indians were their friends. After their crops had all been garnered Governor Bradford thought that God ought to be thanked for the mercy He was showing them. Accordingly he sent men to hunt wild turkeys and upon their return the little colony on New England's soil gathered together to thank God for His mercy and to celebrate the day with festivity. It was a great feast and one that meant much to the sturdy pioneers. Such prayers for help and guidance through the coming winter, and such thanks for the products of their labors, have perhaps seldom been heard by so many at one time. The feast was repeated in succeeding years and soon it became a custom that was followed throughout the New England states at different periods in the year until in 1863 when the president of the United States set apart a special day for national thanksgiving.

From such a beginning has arisen the grand national anniversary of Thanksgiving day. Thanksgiving is indeed a home festival; it is the day when the young come home from college, and the middle aged return to the home of their childhood. It is a day when mother longs for her sons and daughters and when father grows reminiscent. It is a day that is crowded with memories of the past, sometimes pleasant, sometimes sad. To those whose memories bring sadness to their hearts on that day, let us be kind and thoughtful. Let us take them into our happy homes and help make the day for them what it ought to be for all of us—a day of genuine thanksgiving with prayers rising to God for the many blessings received during the year. Let us repeat what some man filled with the spirit of Thanksgiving said:

Praise God for wheat so white and
sweet of which to make our bread;
Praise God for yellow corn with which
His waiting world is fed;
Praise God for fish and flesh and fowl,
He gave to man for food;
Praise God for every creature which
He made and called it good;
Praise God for winter's store of ice,
praise God for summer's heat;
Praise God for fruit-bearing seed, to
you it is for meat;
Praise God for all the bounty by which
the world is fed;
Praise God, His children all, to whom
He gives their daily bread.

—Farmer's Tribune.

## THE THANKSGIVING DINNER.

THE DAY of days has come again; the feast day of the season is here, the day when the prayers of a Nation are raised in one glad thanksgiving praise. Aside from the day being devoted to thanks it is also a time when families are reunited, when they gather around the table and enjoy a genuine feast. Let us go back to the New England home and imagine ourselves partaking of a genuine New England dinner:

MENU.

Oyster Soup

Dill Pickles Crackers
Turkey With Chestnut Dressing
Brown Gravy Sweet Potatoes
Mashed White Potatoes
Cauliflower in Cream
Green Tomato Preserves
Sweet Apple Pickles Cranberry Jelly
Celery
White and Brown Bread
Apple and Nut Salad Wafers
Pumpkin Pie Apple Pie
Cheese Coffee

This menu, while large, is not unlike those served by our forefathers. We have things to contend with which did not exist in earlier days. The meat for the feast was the cheapest part of their dinner; today it is the most expensive. We have to think of the turkey bill first and purchase other things with the money left. If you must purchase a turkey for the Thanksgiving dinner be sure to buy a young bird. If you buy a live bird pick one with smooth, spineless legs and without a tuft of heavy bristles on the breast. If you are compelled to purchase one from a butcher then take one with smooth legs, with a breast bone that is easily bent, and one whose flesh shows blue underneath the skin.

In stuffing the fowl do not fill it too full; put in just enough to make the bird look natural. If there is a possibility of the meat being dry it is a good plan to lard it. To do this cut gashes in the dry portions of the fowl and put in strips of fat pork one-fourth by one-fourth by one and one-half inches in size. If possible refrain from larding because it spoils

## THANKSGIVING.

Thanksgiving! Thanksgiving! November is here,
The beautiful crown of the wonderful year!
Like doves to the windows from east and from west,
The children come back to the cozy old nest.

Thanksgiving! Thanksgiving! the old folks at home
Are so glad by the fireside to see them all come
Though the forties and fifties are silvering their hair,
They are boys yet and girls to the good people there.

Thanksgiving! Thanksgiving! sit down by the fire,
Talk over old times with the happy old sire;
Tell the mother, whose hair is like new-fallen snow,
That you love her no less than in days long ago.

Oh, the home—the old home! The new may be sweet,
But not like the old to the world-weary feet;
Be it long ere the hearth-light shall fade from its walls,
And the cheerful old love-light go out in its halls.

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point?"

MORE LIGHT

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

THE ANGLE LAMP

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

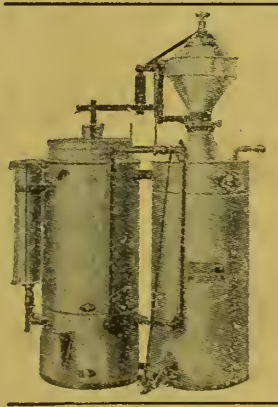
Boesch Lamp Co. 1135 Mission St. San Francisco
Established 1869. Incorporated 1890.

SAN FRANCISCO BUSINESS COLLEGE

ALBERT S. WEAVER PRESIDENT

Cor. Market, Eddy, and Powell Sts., San Francisco

New building, new equipment; located in the best business district. One of the lightest, most convenient and best-equipped business colleges in America. Write for information about the great opportunities offered to trained office workers in the new San Francisco.



Superior Acetylene Generator

1. Installed at small cost.
2. Requires little attention once or twice a month.
3. It is safe, convenient and economical.
4. It does not increase insurance rates.
5. Makes the user independent of gas companies.
6. **Acetylene** makes a brighter light than any other light.
7. It is cheaper than oil and free from smoke.
8. It saves the labor of caring for lamps.
9. It is a good fuel.

We want agents. Write for catalog No. 1.

Superior Light & Heat Company

the appearance of the fowl when put on the table; it also makes the gravy too fat and gives a decided porky flavor to the meat. To make the meat juicy in another way, one which is perhaps more commonly used, make a basting water by using one quart of water, two tablespoonfuls of butter, and pepper and salt to taste. Every 15 or 20 minutes while the fowl is in the oven moisten the dry parts with this. When completely roasted lift the turkey into a dripping pan and set it back in the oven until the rest of the dinner is ready to be served.

In making the oyster soup,say for 10 people, purchase two quarts of oysters and use two and one-half quarts whole milk and one quart of water and enough butter to suit the taste. Drain off the liquid from the oysters and put it and the milk in a double boiler to heat. When at the boiling point add the oysters and cook until they commence to curl up around the edges. Then salt and pepper and add a piece of butter. Serve at once in warm soup plates.

In baking the pies make a rich pastry for lining the tins and prepare the filling for pumpkin pie as follows: For each pie use one and one-half cups of well cooked pumpkin; one and one-half cups of milk; one cup of sugar and two eggs. Add ginger, cinnamon and salt to taste, beat thoroughly and put into the crust. Bake in a slow oven until brown. Just before serving grate a generous amount of cheese over the top.

For apple pie prepare several tart apples and cut them into thin slices; add the sliced apples to the pie and pour over them one cup of sugar, one-half teaspoonful of cinnamon, then drop several small pieces of butter on the top and put on the upper crust. Bake in a medium oven until the apples are done.

For making brown bread use two cups of sweet milk, two-thirds of a cup of molasses; one and one-half cups of graham flour; two cups of corn meal; two teaspoonfuls of baking powder; and three-fourths of a teaspoonful of salt. Mix well and put into well greased pudding molds. Steam three hours.

In making cranberry sauce use one quart of cranberries; one and three-fourths cups of water. Cook until the skins burst; then rub through a colander and remove the latter. Then put the berries on the back of the stove and add two cups of sugar. When the sugar is dissolved and well mixed turn the sauce into a mold previously moistened with cold water. It will then form a stiff jelly.

Our New England ancestors never served meals in courses, consequently when their Thanksgiving dinners were served everything for the meal was put on the table and it is said that their tables fairly groaned with the weight of good things. We may follow the old New England custom or serve the dinner partially or wholly in courses.—Farmer's Tribune.

### RESEAT AND RECEIPT.

David Slowpay: "I shall bring you back those dark trousers to be reseated, Mr. Snip. You know I sit a good deal." Mr. Snip (tailor): "All right; and if you'll bring the bill I sent you six months ago, I will be pleased to receipt that also. You know I've stood a good deal."—Baker's Helper.

### THE THANKSGIVING TABLE.

After the use for long years of a pumpkin centerpiece on the table on Thanksgiving day many a hostess will heave a sigh of relief to have something suggested which is quite as characteristic in color as the pumpkin, and far more artistic. This is a great, beautiful bunch of yellow chrysanthemums set off and relieved by large sprays of dead, brown oak leaves. The combination is really lovely, and most suitable to autumn, and to a pretty dinner-table. If the first course is grapefruit, this can be arranged before the family and guests sit down, and the yellow will still further emphasize that of the flowers.

**Flowers for Decorating.**

In selecting flowers for decorating a table a great deal of thought should be given to the subject of color. The room itself must be considered, the colors of the china to be used, and, if possible, the colors of the gowns to be worn at the table. The color effect is fully as important as the beauty of the flowers themselves or their arrangement. It is very important to light a table from below rather than from above. If possible, one should always either have candles or small lamps. If this is not enough, the light from above should be almost indistinguishable. The

## Harlow-Bricca Company

**San Francisco**

## $24.85

**for our "International" Sewing Machine with Automatic Lift, Drop Head and every improvement known to the machine world.**

**Makes Double Lock Stitch**

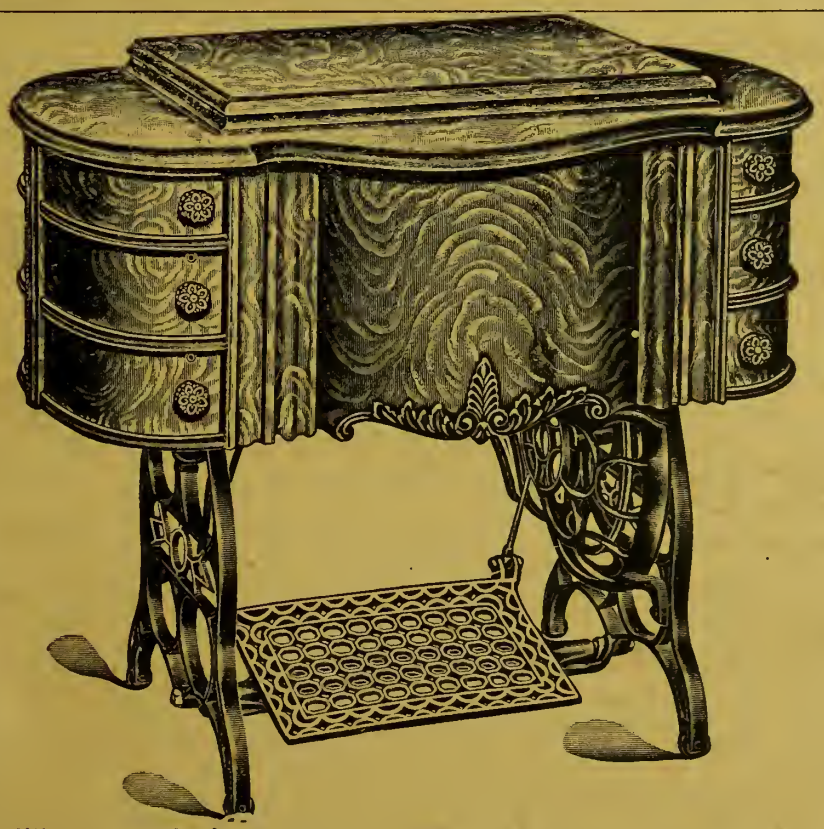
The freight amounts to almost nothing compared to the tremendous saving.

### Ball Bearing, $24.85

$24.85 is our price for our "International," the handsomest, most practical, best finished Sewing Machine ever offered under $50.00; we'll go further than this, and guarantee that no better Sewing Machine is made at any price, by anybody, anywhere.

**THREE MONTHS' TRIAL.**

Send us your order for our seven drawer International at $24.85 or or our four-drawer International at $23.85, and enclose our price, and we will promptly ship the machine to you carefully packed with the understanding that you can put it in your home, test it, try it and use it, in any manner that you have been accustomed and if you are for any reason dissatisfied, you have the privilege of returning it to us at any time within three months. We will not only refund the price you paid for it, but will also refund the freight charges both ways. WE GUARANTEE every Sewing Machine to reach you in the most perfect condition and ready for use the moment you have uncrated it.



**OUR TEN-YEAR GUARANTEE.**

With every Sewing Machine we sell we issue a written binding ten-year guarantee so that if during that length of time any piece or part gives out by reason of defect of material or workmanship, we will replace or repair it absolutely free of charge. More than that we give you the signature of our factory which is one of the pioneer Sewing Machine factories of the world as well as one of the largest and most successful.

**LOWER PRICED MACHINES.**

We have lower-priced machines but advise you to buy our "International." For example: we can give you a five-drawer, drop head style machine with latest design woodwork, our improved "WENTWORTH," for **$13.65**, and it's better, far better than most machines selling for as high as $30.00.

At $19.65 we can give you our "REGENT" drop head, automatic lift, and beautifully designed woodwork. An absolutely high-grade machine having all the latest and most desirable mechanical improvements and one that will last a lifetime, and give better service than most machines selling as high as $40.00.

WE RECOMMEND OUR INTERNATIONAL. When you buy a Sewing Machine you are buying an article that is to be a lifelong companion and assistant in the duties of your home. This being the case, you should exercise much care and judgment in making your selection, bearing in mind during that period that it is to your interest to pick out a Sewing Machine on which you can fully depend for full satisfactory service over a long period of years.

**DESCRIPTION OF OUR INTERNATIONAL SEWING MACHINE AS ILLUSTRATED.**

No higher grade, no easier running, no better or more durable Sewing Machine ever produced in any country at any price.

THE SEWING MACHINE IS A WORK-DOER. Hence the most important part is the head which contains the particular works. The head in our International has a combination of the best mechanical features and has been compared and tested alongside other leading standard makes.

This illustration shows seven-drawer International Sewing Machine with drop head and automatic lift—the highest type of family Sewing Machine.

THE CASE OF THE INTERNATIONAL MODEL is decidedly attractive in design and is highly polished quarter-sawed oak, most solid and substantial in construction. The design is colonial and there are none of the flashy trimmings found on cheaper and flashy machines. Everything is simple and elegant.

THE SIX SIDE DRAWERS show off the handsome grain of the quartered oak to excellent advantage. They are fitted with attractively designed brass pulls and there is an eighteen-inch tape measure on the table, a convenience which the operator will be quick to appreciate.

AUTOMATIC LIFT. By means of the tested steel cable lifting device the sewing head is raised AUTOMATICALLY to position with one motion of the arm.

THE INTERNATIONAL SEWING HEAD, fully described above, has more improvements than any other machine in the market.

THE WONDERFUL DISC TENSION with device which AUTOMATICALLY releases all tension on the upper thread when the presser bar is raised to remove work is a time-saving feature of much benefit to the owner of the machine. Then there is the Automatic Bobbin Winder, the Automatic Stitch Regulator, the Automatic Device for throwing machine out of gear when winding bobbin, the Self-threading Shuttle, the Steel Capped Needle Bar, the Self-setting Needle, the Positive Take-up, and all the Steel Working Parts hardened in oil.

THE INTERNATIONAL BALL BEARING STAND. The wheel operates on two sets of ball bearings traveling independently with treadle by unbreakable polished steel pitman with ball and socket connection which makes hard and noisy running an impossibility.

FREE A FULL SET OF HIGHLY NICKEL PLATED STEEL FOOT ATTACHMENTS, packed in a velvet-lined metal box is a source of much service and comfort to the owner of an International machine. It contains as follows: Ruffler, Tucker, Binder, Braider, Feller, Quilter, Four Assorted Hemmers, Cloth Guide, Twelve Needles, Six Bobbins, Two Screw Drivers, and filled Oil Can.

Our "International," seven-drawer, exactly as illustrated including full set of highly nickeled steel attachments .....$24.85

Our "International," four-drawer, including full set of highly nickeled steel attachments....**$23.85**

Mayer WORK SHOES

It is not necessary for a work shoe to look clumsy to give good wear. Have your dealer show you the good looking, comfortable, well-fitting, Mayer Work Shoes.

candle-light is much the prettiest light for the decoration as well as much more becoming to the guests.—Harpers Bazaar.

### Another Table Decoration Suggestion.

One effective scheme of decoration consists of dark red oak leaves, branches of pine and pumpkins. A large pumpkin is hollowed out and the top cut down low enough to make it into an effective flower bowl. This is for the center of the table, and the branches of oak and pine are gracefully arranged in it. The bunch must be loosely arranged, so that the orange of the pumpkin will show through, giving glimpses of brilliant color to offset the somber tones of the foliage. A mat of green pine, with here and there some drifting oak leaves, is arranged around the base of the pumpkin, and smaller artificial silk pumpkins are placed here and there to give color. Bonbon boxes made in the shape of pumpkins are placed around at the plates, with tiny branches of oak leaves. The shades of the candles are of orange paper made like the large Japanese shades, with here and there a little branch of green pumpkin leaves painted on them. The candlesticks themselves are brass.

Wheat or oats may be combined with the red leaves and arranged in this same way with the pumpkins, but wheat or oats arranged in stacks as the corn is arranged in the field, at harvest-time, are even more effective. There should be one large stack on a mat of wheat in the center of the table, with several small stacks around it, and the little artificial pumpkins scattered among them. The candlesticks at the four corners may become the centers of smaller stacks, with yellow or red candles rising from them without shades. To add to the color effect, orange ribbons may be laid upon the cloth running from the mat of wheat to the corners and sides, and allowed to hang down.

### GOOD TASTE IN VEILS.

"The mission of the veil is to keep the hair in order and to enhance the brilliancy of the complexion," says the Woman's Home Companion for October. "It should not be striking in itself. Heavily-spotted nets and lace veils of conspicuous pattern should be for this reason tabooed. They are trying to rise above their sphere, trying to be something on their own account, and so they conceal the face, and incidentally ruin the eyes.

"Nevertheless, it is the veil with the large, conspicuous mesh that Fashion is specially favoring both in Paris and New York just now.

"For the perfect complexion the best veil is perhaps the plain, fairly large-mesh net which is hardly noticeable and only serves to keep the hair in place. Most of us, however, require in the hard light of out of doors some simple beautifier, and for us the spots and lines of the patterned nets are a boon.

"The most generally becoming veil has a black figure on a white ground; the white net coming close to the skin heightens its fairness, while the black spots accentuate its brilliancy. A veil of this type is becoming according to the size and arrangement of its spots. The black chenille dots with a generous space between act like the old-fashioned "mouche," the touch of black court-plaster at the side of the chin or near the outer corner of the eye, so much affected by the clever beauties of the time of Marie Antoinette. When these spots come closely together the white spaces are not sufficiently large to do their work and the effectiveness of the spots is almost, if not entirely, nullified."

### CURING COLD IN ADVANCE.

We get sick because we are too lazy to keep well, according to Dr. Woods Hutchinson in Woman's Home Companion for October. We are always looking for short cuts to health. Of reputed cures for coughs and cold, he says:

"Their name is literally legion, for hardly a drug can be mentioned, hardly a substance discovered, which is capable of either being swallowed or inhaled, that has not been recommended as a cough remedy. Eight tenths of all colds are mild infections, which run their course until the body has time to produce an antitoxin or antibody to stop their further progress. As this process in reasonably healthy individuals is usually carried out in from four to six days, anything which happens to be given in that time stands a fair chance of getting a reputation as a cure.

"The only sure cure for colds and coughs is to avoid the infections and the foul air of ill-ventilated rooms and buildings in which they breed; to keep the body toned up to fighting pitch, by cold baths and an abundance of fresh air, especially in the bedroom; and if the infection does get a foothold, to assist Nature in her fight against it by rest in the open air, and promoting elimination through the skin, bowels and kidneys.

"In fine, don't tinker with symptoms; look for the cause, and remove it. Don't try to lock the stable door after the horse is stolen, but train your horse to bite strangers. Attack is the best defense. Keep your body at good fighting weight, and you can defy disease. Sunlight, food, fresh air and exercise are the only cure-alls known. Don't worry about disease and what to take when you're sick, but work for health."

### DANDRUFF REMEDY.

The following has been recommended as a cure for dandruff and in incipient baldness. The amount of castor oil may be varied to suit the case:

| | |
|---|---|
| Resorcinol | 4 Gm. |
| Betanaphthol | 2 Gm. |
| Hydrated Chloral | 8 Gm. |
| Tinct. Cantharides | 6 Cc. |
| Tinct. Capsicum | 4 Cc. |
| Castor Oil | 2 to 8 Cc. |
| Cologne Water | 120 Cc. |
| Bay Rum | to make 500 Cc. |

—Merck's Report.

### DIGGERS ALL.

The country chap
Now makes a pass
And digs from earth
His garden sass.

The city man,
By hook or crook,
He digs it from
His pocketbook.

—Boston Globe.

### INCONSIDERATE.

"Yes, I was fined $500 for putting coloring matter in artificial butter."

"Well, didn't you deserve it?"

"Perhaps. But what made me mad was that the judge who imposed the fine had dyed whiskers."—Cleveland Leader.

# General Agriculture

## DODDER IN ALFALFA SEED.

THE appearance of dodder in clover and alfalfa fields is generally most dangerous to the crop. The ordinary operations of mowing, raking, and hauling tend to spread this troublesome parasite, and with every new center of infection the chances of the crop grow less. A recent circular of the New York Experiment Station at Geneva describes the injury resulting from dodder in alfalfa fields as follows:

Dodder is a yellow, thread-like twining weed which is exceedingly troublesome in alfalfa fields. It appears in circular spots 3 to 30 feet or more in diameter. At the center of the spot the alfalfa is killed out, while around the margin the ground is covered with a mat of yellow threads which twine closely about the stems of the alfalfa plants and slowly strangle them. The spots increase in size from year to year. Many fields have been completely ruined by dodder. It is not often injurious to other crops (except red clover), but once established in

Mountain Roadside

an alfalfa field it is very difficult to eradicate without killing the alfalfa.

As dodder is usually introduced with clover and alfalfa seed, the purchase and use of dodder-free seed can not be too strongly urged. Clean seed, however, can not always be secured, and therefore cleaning the seed is often necessary. Frequently neither the purchaser nor the seed dealer knows dodder seed, and consequently in many cses the first proof of its introduction is the appearance in the field of the weed itself. In view of these facts, the New York Station recommends that seed be examineu before it is sown to determine the presence of dodder.

Alfalfa seed is larger than dodder seed and advantage was taken of this fact by the station to perfect a method by which commercial alfalfa seed may be made practically free from dodder and safe to sow. It was found that dodder seeds are readily removed by sifting through a wire sieve having 20 meshes to the inch. Since ready-made sieves of this mesh are not readily obtainable, it is advised to construct a light, wooden frame 12 inches square by 3 inches deep and tack over the bottom of it 20 by 20 mesh steel-wire cloth of No. 34 Washburn & Moen gauge wire. This quantity of wire cloth ought not to cost more than 15 or 20 cents. In case brass or copper wire cloth is used the wire should be No. 32 on the English gauge. It is important that the wire cloth used be exactly 20 by 20 mesh, which may be determined by placing a ruler on the sieve or cloth and counting the number of spaces to the inch. With a sieve of this kind it is estimated that a man can clean from 3 to 7 bushels of alfalfa seed per day. From one-fourth to one-half pound of seed, and no more, should be put into the sieve at a time and vigorously shaken for one-half minute. To make the work uniformly thorough the use of a cup holding not over one-half pound of seed and careful timing of the sifting is recommended. If the seed contains but little dodder one sifting may do, but when much dodder is present, and particularly if it is of the large-seeded kind, two siftings, both made strictly as directed, are advised.

In experimenting with this method it was observed that besides the dodder seeds various other small weed seeds, broken seeds, and dirt, as well as some of the smaller alfalfa seeds, were also removed by sifting. The siftings vary from about one to 5 pounds per bushel according to the original cleanness of the seed and the thoroughness of the sifting. The rejection of the siftings is considered as causing but little if any loss.

## CLIMATE OF ALASKA.

"Alaska has two climatic belts, which may be designated as "the coast region" and "the interior" by which latter term is meant the region north of the coast range. In the coast region the climate is moist and mild in winter and comparatively cold in summer. In the interior the climate is dry, with a comparatively warm and short summer and long winter. In the coast belt the rainfall is heaviest in southeastern Alaska and decreases gradually as we pass westward to the Aleutian Islands, though there are local regions, as for instance, in Prince William Sound, where the rainfall is heavier than in southeastern Alaska. At Sitka, the average yearly precipitation is ninety-six inches, and the mean annual temperature is forty-three degrees, or almost the same as that of Washington, D. C. The winter temperature at Sitka seldom falls to zero, and in summer it frequently does not go above seventy on the warmest days. The short warm summer with an abundance of daylight, produces a rapid growth of every kind of vegetables, and thus it is possible to mature the grain above mentioned.

"Finland approaches Alaska in climatic conditions more closely than any other European country, and it may be of interest to point out some of the agricultural possibilities of that country. Finland lies wholly north of the sixtieth parallel of north latitude. In Alaska, the sixtieth parallel passes through Prince William Sound, and all of southeastern and southwestern Alaska lies south of this latitude. Finland has an area of 148,000 square miles, or about one-fourth of the area of Alaska. One-third of this is timber and tundra, another one-third is covered with inland lakes and only about thirty-four per cent of the whole, or in round numbers about 50,000 square miles is devoted to agriculture. This area supports a population of 3,000,000 people, ninety per cent of whom live in the country and are engaged in agricultural industries. The country produces a considerable surplus of grain for export, chiefly oats, and it is one of the finest dairy countries the world. Butter and cheese are exported in large quantities. Now if it is possible for Finland to support 3,000,000 people north of the sixtieth parallel on one-half of the area that can be made available for agricultural purposes in Alaska, what are the possibilities of Alaska? Alaska has in addition the richest mining belts in the world; the most extensive coast line and richest fisheries of any similar area in the world, and vast virgin forests. It does not seem unreasonable to assume that Alaska is also capable of supporting 5,000,000 people. Nature has provided the resources with a lavish hand. It only requires the industry of men to transform them into wealth."

---

Because of range disputes, several homes and barns have been destroyed by incendiaries at Prairie City, Oregon.

---

A small fly has been found in the Imperial Valley which it is thought does much damage to the alfalfa.

**Who Pays for the Error?**

when grains and produce are sold by measure or guess, instead of by weight—usually the honest farmer.

After the hard work of planting, cultivating and harvesting, can you feel that you have made the most of your resources if you do not know exactly how much you have to market—where it came from and how much it cost?

A good scale is just as necessary on the farm as in the elevator or factory. Without it you buy at the seller's weights; estimate the amount of your crops—the gain of your live stock and, perhaps, too often chickens are counted before they are hatched.

**Fairbanks Scales** in your barn-yard will enable you to credit every field with its exact production; you can keep tab on your feeders and know—not only when they are ready, but what they are costing and what they will bring. When your crops are harvested—you know what you have done for the season just as well as if you had the money in the bank.

You need the help of Fairbanks Scales right at the start, when it takes careful planning to make ends meet, and when you find how much they really save, you will wonder how you ever got along without them.

### Honey.

White comb .....14@15
Lighht Amber .....10@12
Extracted W W .....7½
Extracted light amber .....6½@7
Beeswax per lb. .....25@29

### Hay.

Scott, Magner & Miller say:

Arrivals of hay for the past week have been 2344 tons, as against 2625 tons for the week previous, showing a slight falling off in receipts. Contrary to last week's arrivals, two-thirds of this hay has arrived by railroad. The lack of wind on the rivers has caused delay in a large fleet of boats which are out after hay, but this fleet are commencing to arrive, several of them coming in today, and we look for large receipts by water the coming week.

The country demand is almost nominal; nearly all sections of the state having had very nice warm rains during the past week, and fair prospect for good pasturage is in sight. Sections of the country where we were shipping hay weekly last season at this time, are now writing asking what we can give them for their hay, showing that they have hay to sell where last year they were importing it.

We are still confronted with the railroad transportation problem, and are only able to secure cars for shipment of hay by ordering them under the Reciprocal Demurrage Act passed by the last Legislature, and even under these conditions the railroads are taking all the time allowed them under the Act after orders are placed before delivering the cars to load.

Adfalfa is in lighter supply, and moving off a little more freely. Straw is also in light supply, but the demand for same is very light. We quote the general range of prices on today's market as follows:

This week's quotations are:

Choice wheat hay .....18.50@19.50
No. 1 wheat or wheat & oat 16.50@17.50
No. 2 wheat or wheat & oat 14.00@15.00
Choice tame oat .....16.00@17.50
Other tame oats .....13.00@15.00
New crop wild .....10.00@14.00
Stock hay .....8.00@9.00
Alfalfa .....10.00@13.00
Straw .....55@65

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.77½ @ 1.82½ |
| Barley No. 1 | 1.40 @ 1.47½ |
| Oats white | 1.57½ @ 1.65 |

| Middlings | 36.00 @ 37.50 |
| Mixed feed per ton | 28.00 @ 33.00 |
| Shorts | 31.50 @ 33.00 |

## Citrus Market

LOS ANGELES, Nov. 17, 1900.

Navel oranges which have arrived in the eastern markets are now selling fairly well. There has been some complaint of green fruit, and the market is not so strong as at the first offerings. This fruit is coming in contact with large shipments of Floridas which are now coming in very good condition. Last shipments of Valencias are cleaning up and are holding up good prices. All shipments of navels have been from either the San Joaquin or Sacramento Valleys.

Lemons are holding up very strong and with limited receipts from the Mediterranean, it is thought that winter shipments will command a good price.

**SHIPMENTS.**

Total shipments of citrus fruits since Nov. 1st, 249 cars of which 132 were oranges and 117 lemons. To same date last season 206 cars of which 36 were oranges and 170 lemons.

This report does not include Tulare and Fresno counties and northern California shipments.

---

NEW YORK, Nov. 11.—Five cars of Valencias sold. Market firm on good stock. Weather clear and favorable.

## Business Notes

**SPRAYING.**

Spraying deciduous fruit trees has become an absolute necessity with the California fruit grower. At various conventions held by fruit growers in this state, it has been made manifest that the trees that were sprayed at the right time with lime and sulphur solution have borne fruit free from worms, whereas trees not sprayed have borne fruit that was condemned in the north-western markets and in many cases a total loss.

The very small cost of spraying a tree makes it no excuse for any grower to have scaly or wormy fruit when he can just as well have first-class fruit. The celebrated preparation, Rex Lime & Sulphur Solution, manufactured by the California Rex Spray Company at Benicia, California, has been very extensively and successfully used, and is on the market at a price that the farmer cannot afford to lose the time in making an article that at best only approximates in strength and efficiency the prepared spray. The thoughtful orchardist should see to it that his orchard is sprayed, and well sprayed at the proper time.

**TURKEY BOOK.**

A new and enlarged edition of the book Turkeys—Their Care and Management has just been completed by the Reliable Poultry Journal Pub. Co. The new book has been revised to meet the standard requirements for Turkeys and anticipates the American Standard of Perfection which is to be published in 1910.

Some of the subjects dealt with in this new book are: How the Turkey Got its Name; Description of the Seven Standard Varieties, The Care of Breeding Stock, Mating the Breeders, Hatching the Eggs, Coops and Houses for Turkeys and Poults, and Remedies for Turkey Diseases. Well known breeders have contributed special articles on their favorite varieties including the Bronze, White Holland, Narragansett and Wild Turkeys, with special illustrations. In these they tell why they prefer the variety and how it is handled to secure best results. The price is 75c.

**NEW 1910 FREE CATALOG.**

The Pioneer Hatchery Co., 112 East 8th, Los Angeles, now have their new 32-page illustrated catalogue in the press. This book illustrates and describes all of the baby chicks, ducklings, turkeys and geese sold by them. Just send your name and mention this paper, and the book will come.

**READY ROOFING.**

Genasco Ready Roofing is a great fire-resister. Sparks and embers that drop on it extinguish themselves without injury to the roofing. Genasco is made of Trinidad Lake asphalt. Besides resisting fire, it also resists an even greater enemy—the weather. It withstands rain, air, sun, heat, cold, and will not crack, break, or rot. It is so easy to lay that you or any intelligent farm hand can do it. "The Good Roof Guide Book" is a valuable manual issued and sent without charge by the Barber Asphalt Paving Company, Philadelphia.

---

John S. Armstrong has a faculty of producing beautiful and striking catalogues. We thought that his last year's production had reached the limit, but we must confess that the 1910 edition beats any of the former ones. The cover is especially striking in its gold and red and black. The book is composed of 56 pages and cover, and is full of illustrations and descriptions of fruits handled by this large nursery. The list of fruits is most valuable in this, that where different varieties are given, the time of ripening is also stated, so that one may choose his family orchard fruits according to season. The Kruckeberg Press did the work and it is entitled to much credit for a fine piece of work.

**Wireless Telegraphy** Now is the time to engage in the study of this new science. 1,000 operators wanted to fill positions created by U.S. government action. Salary of trained operators ranges from $15 to $40 per week.

**The Wireless Institute of California** is the best equipped wireless school in the world for teaching this science. We are located so that our high power station is in daily conversations with all stations on the Pacific Coast. R. R. Commercial School of Telegraphy owned and operated in connection with us. We can qualify you for a position anywhere. Young men and women write for descriptive circulars.

Employment possibilities very strong in Sacramento.

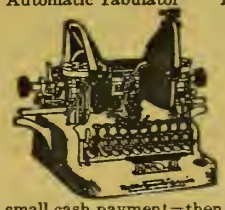
# A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



**Yours for 17 Cents a Day!**

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

**A Quarter of a Million People are Making Money With**

The OLIVER Typewriter

**The Standard Visible Writer**

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

**"An Oliver Typewriter in Every Home!"**

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

# Good Opportunities for Dairying in California

From an Address Delivered by Geo. A. Smith, of Corcoran, at the California Creamery Operators' Convention at Porterville, November 18

THE dairy business in California in the last few years has made wonderful strides of progress. It has grown by leaps and bounds and is rapidly being recognized as one of the important branches of agriculture, if not the most important in our great state, and it must continue so if it keeps pace with the rapid development of our great country, but it seems as yet far from catching up with the demands of an ever increasing population. The dairy business today is generally recognized both East and West as the safest, surest and best paying branch of agriculture, and its results are almost mathematical. If this be true, what is the opportunity for dairying in California?

The Modesto-Turlock Irrigation project, together with others of a similar character in this and other states has demonstrated the cheapness and the practicability of storing water in the mountains and has made this system so popular that other systems of a like nature are now under consideration. In the near future, water by this system will be provided for large areas of worn out grain lands, which have become almost non-productive through the continued cropping for grain through a long series of years, forcing their owners to abandon grain farming and to cut up into small subdivisions immense tracts of land, which with a necessary and adequate water supply available is soon sold to settlers. When this worn out land is irrigated and seeded to alfalfa its productive value is increased many fold and affords great opportunity for profitable dairying so that localities and towns almost abandoned are made productive. progressive, thriving and prosperous.

In many localities in this state, enormous tracts of land are being supplied with water diverted from streams and made to flow by gravity through canals and ditches and distributed over land of from fair to good quality, which lands are made highly productive alfalfa fields. There the dairy business will be found flourishing and increasing in proportion to the number of settlers that are taking advantage of these favorable conditions. Alfalfa means green feed all the year and it also means that one acre will provide fee for one animal. A gravity water supply from streams is the cheapest system of irrigation and the land reclaimed by this system is usually good and especially well adapted to the dairy business, and under these most favorable conditions splendid opportunity is afforded for dairying. A number of important systems of this nature are in successful use in this state. Among the most prominent is the system in use in the Imperial Valley. Others less extensive are under consideration at the present time, which will no doubt afford a splendid opportunity to a large number of dairymen to enter this profitable business or to increase the business if already in it.

In many places where it is not practical to secure water from the mountains or streams it is possible to sink wells, which provided with a pumping plant furnished with gasoline or electric power, while more expensive to install and operate furnish an adequate, permanent and independent source of water supply at a cost which leaves a satisfactory profit to the owner. A plant of this kind makes the production of from six to eight good crops of alfalfa per year certain, and insures against the total failure in a dry year of valuable crops and prevents the loss of years of toil. The extensive use of pumps and engines among the farmers and dairymen has led to the perfecting of these machines and lowering the cost to within reach of the average dairyman. The demand for power to operate pumping plants has also led to the development of electrical energy from water power in the mountains, so that dairymen can now secure power from the power companies at a minimum cost, largely eliminating the cost for attendance and repairs. Being so very convenient this power has become quite popular for pumping plants. The improved equipment and the greater skill in sinking and developing pumping wells have made the development of water practical where heretofore it was thought quite impossible, and is affording excellent opportunity for profitable dairying where none existed on account of the inability to produce cow feed.

In other localities where it is not practical or possible to secure water from the mountains, streams or pumping plants, the development of water by deep boring, while more expensive to install than the three former systems mentioned, the cost of maintenance and operation is less than in any other system and where artesian water can be secured in sufficient quantities, this system is the best, most independent and satisfactory as these artesian wells are nearly always found in localities where the land is exceptionally good, where we find the most favorable and the best opportunity for dairying.

A more economical and scientific use of water is being practised so that the volume of water now available is sufficient to irrigate and make productive a larger area, enabling those already engaged in the dairy business to pursue it more extensively and providing water for land where none has been previously used, thereby affording a greater opportunity for dairying.

The climatic advantages of California for the dairy business are simply marvelous. Our winter is one continual springtime—no snow, no wintery winds, no blizzards, no ice and sleet to decrease the production and make warm and expensive barns necessary. On the contrary, in the winter our dairy cattle are grazing on green pastures of alfalfa and natural grasses. The dairy cattle of the irrigated sections are never without green feed every day in the year. The absence of humidity in the atmosphere robs the summer heat of its oppressiveness which is so apparent in so many parts of the East.

In our haying season, rain is unknown so that the gathering of crop after crop is attended without loss from this source. These ideal climatic conditions no doubt have a great deal to do with the health of the dairy cattle of this state. With our mild winters, our everlasting growing season, combined with irrigation which makes our soil highly productive, and with nature on the side of the dairyman, it is truly the dairyman's opportunity.

The leading dairy sections of California are within easy reach of one or the other of the two great consuming points of the state, namely, San Francisco and Los Angeles, whose dairy markets are the highest in the United States. This together with its excellent transportation facilities makes dairying a favorite enterprise with people of both large and small means, who invariably find the returns from this investment most satisfactory.

The average price of dairy products for the last twelve months has surpassed our most sanguine expectations. We can not reasonably expect to receive any higher prices. Therefore the only way left for us to obtain greater profits is to improve our herds, thereby securing a greater average production per cow and consequently a greater profit. In fact the high price for dairy products is causing the thinking, progressive dairymen of the state to improve the quality of their stock by the introduction of improved, registered dairy bulls. In many herds the yield per cow has been increased from 25 to 50 per cent by their continued use. In addition to the increased production per cow, they have also increased the actual selling value per cow from 25 to 50 per cent, for the reason whenever a dairyman increases the production of his herd, he, at the same time, also increases its selling value in the same proportion. Creamery men can do no better thing to uplift the dairyman to build up and increase the dairy business and its profits, and incidentally their own, by doing all in their power to encourage the use of pure-bred sires. No investment the dairyman can make will bring such large returns in net profits.

If any dairyman wishes to improve the production of his herd in order that he may have a greater profit year after year, he can accomplish it in two ways. He can by keeping a record of his cows determine his best cows and dispose of the others and by breeding them to a pure bred bull, of the dairy breed which he favors most, and one that comes from a long line of ancestry that has been noted for large production of milk and butter fat, he is reasonably sure to raise young cows much better than their mothers. If these young cows are used to replace the poor cows he will secure a much greater net profit per cow and at the same time increase the selling value of the herd.

The other way is to buy cows of large producing capacity; but such cows are hard to find and are not usually for sale and cost more than the average dairyman is willing to pay, and he will find that if he wants to secure a herd of good cows he must raise them himself, and the only way he can do this is by the continued use of a good pure-bred sire. The sire, if a good one, may be much more than half the herd, when judged by the increased production and the accumulated effect of the influence for good he transmits. It is actually a fact that the sire may within a few years and at comparatively slight expense completely transform a dairy herd and actually double its net profits. The intelligent, progressive, successful dairyman by his carefully

(Continued on Page 524.)

# This powerful I.H.C. Engine will reclaim your waste land

IT is one of the great family of I.H.C. engines which is bringing unheard-of farm prosperity where all was a barren waste a few years ago.

Thousands of farmers are using these simple, powerful engines for irrigating their lands, and they have no other source of water supply. The engines pump water where it is needed. They pump water in quantities. They do it economically.

Have you a water problem to solve? Why not look into the matter and see what one of these engines will do for you?

## What I. H. C. Gasoline Engines Mean to Irrigators

**First**—In hundreds of cases they avoid the necessity of going away up-stream and building long, expensive ditches.

**Second**—They do away with costly ditch maintenance.

**Third**—They make an independent water supply possible.

**Fourth**—They enable you to store in reservoirs on your own farm the water that would otherwise flow by in the low-lying stream and run to waste.

You know the trouble is not so much a scarcity of water as of getting the water to the right place. An I. H. C. Gasoline Engine enables you to take advantage of the low-lying lake or slough or spring on your place, or to pump water from the stream that flows by at the foot of the bluff.

The I. H. C. line includes an engine for every section and every problem—all sizes for all farm uses—vertical, horizontal—both stationary and portable; engines on skids; sawing, pumping and spraying outfits. Also I. H. C. gasoline tractors—first-prize-gold-medal winners—the best all-'round farm tractor by test.

An I. H. C. gasoline engine not only frees you from the worries of uncertain rainfalls and the irregularities of gravity irrigation, but the problem of the hired man is simplified—the efficiency of your other farm machines is more than doubled. It will operate your grinder, fanning mill, cream separator, churn, pump, thresher; your bean huller, cider press, alfalfa cutter, and any other machines requiring power.

## THOROUGHNESS IN POMOLOGY.

By Prof. A. J. Cook, Pomona College.

I believe it goes without saying that the greatest loss to our orchardists at the present time is lack of thoroughness especially in cultivation. I have been visiting quite a number of orchards of late. Some are showing no lack of fruit, and the trees exhibit a wonderful thrift and luxuriance. In every case where this is true there is a splendid cultivation. The ground is always mellow, and the dry earth mulch all that any one could desire.

The loss from the lack of such cultivation, too often seen even in the orchards ahout here where the intelligence is so marked and exceptional, is lamentahle indeed. Of course, we must have plenty of water, and it is prohable that great loss comes from lack of fertilization; hut I imagine that many of our orchards would bear heavy crops very likely for years with little attention to the fertilizing elements if cultivation was all that could he desired.

It would pay any orchardist of California to visit the great Arlington orchards at Riverside. They are indeed a wonder. Such trees and vigor of growth is seldom seen in any part of the world! The excellent cultivation is just as patent. Indeed, anywhere in those great orchards,—and I have gone extensively over them—we find this thorough stirring of the soil that must surely make a thick pocket hook. It need not be said that the trees are loaded with finest fruit. The Arlington orchards are not only a source of great income to the owners, hut they are an ohject lesson which must do much to improve the orchard culture of our favored region.

In one town which I lately visited there were several large fine orchards. Some of these were very thrifty and loaded with the finest fruit. Others showed chlororosis, or "yellow leaf," and the fruit was not nearly as much in evidence. In these last orchards in every case the ground was hard and showed a lack of cultivation.

I wish we could do something to get all our orchardists to practice this better method of tillage. If we had a good pomological club in every neighborhood we might hope soon to reach this ideal.

## BLACK SCALE AND NIGHTSHADE.

Some months since this department quoted an article written hy Mr. E. O. Essig, since appointed horticultural commissioner of Ventura county, touching upon the necessity of eradicating nightshade from orchards if they are to he kept free from black scale. Mr. Essig now writes that at the present time effective work can he done hy ridding the orchards of the weed. So he sends this second reminder.

* * *

The handling of hlack scale is one of the prohlems every fruit grower in California has to face every year. Any method that can he used to keep it down adds to the quality of the crop and to the financial returns of the orchard. Parasites will do much to aid in this after fumigation has reduced the numhers of the scale. In this county fumigation for this insect has been successful in every sense of the word and there is no douht hut that it will keep an orchard free from smut and injury due to scale if employed every three or four years. But this is true only when all of the orchards of a community are regularly fumigated and when the nightshade is kept roots and all out of the orchards. This last caution I wish to emphasize in this article. Black scale has a particular liking for the white flowered night shade (Solanum douglasli) which too often grows under the citrus trees. The scale easily climbs from the limbs of the tree to the plant, and may very often be seen in great numbers on the stems of the plant. As soon as cold weather sets in the scale works towards the roots and may go as far as six inches under ground. They are there before the fumigating season closes and are never killed, as ground is a sure protection against the gas. Neither does the Scutellista work underground, so there is a constant reserve for more scale. Nightshade is abundant in a great majority of orchards farthest from the coast in this county and the wide awake fruit grower will see to it immediately that it he removed and if infested with scale, burned. In too many cases the plant is simply broken off at the ground surface. This is due to the fact that a great many small holes are bored at this place to admit a caterpillar which feeds and pupates in the plant just under the ground. In a majority of the cases the roots have been in the ground for years, while the new shoots have heen repeatedly broken off. The scale breeds on the roots at all times of the year. I have found adult egg-laying females and all other stages on the same plant in January, while ahove ground the eggs were all laid hy the last of Septemher.

The maln thing is to get the roots out of the ground, since new shoots are a means of letting the young from the nightshade to the tree. Now after the first rains is the time to get rid of this weed, while the ground is soft and all of the roots may he removed. Especially should growers do thls who have fumigated this fall. It pays.—E. O. Essig.

## COVER CROPS.

A cover crop is valuahle since it furnishes the indispensahle humus. Even if it furnished no nitrogen it feeds the plants indirectly, for by improving the capillarity of the soil it facilitates the movement of soil-moisture, and in this way reduces the limit of adequacy of all plant foods.

But on the other hand, the farmer or fruit grower who depends upon his cover crop for all his nitrogen is simply inviting loss, for it must necessarily be towards summer before a cover crop plowed under in the spring can furnish any nitrogen to the growing crop, and the time lost in the heginning of the season is never recovered. A month in the early growing season, from the farmer's standpoint, is worth two later on.

It is said that the feeding of the pig in the first six weeks determines the value of the hog. This is no less true of the tree; and it should he remembered that there is practically a new tree every year, (excepting in the case of the endogens such as palms, etc.), the older growth merely supporting the new and furnishing channels for the passage of food supplies.

Finally, it is rank extravagance not to apply sufficient nitrogen in an immediately availahle form as soon as growth hegins in the early spring; and the growers whose experience suggests this advice are not only getting adequate returns in the crop, but are also rendering their trees more resistant to their hesetting diseases.—R. R. Snowden, Chemist.

## IN FLORIDA.

Reports to the Florida Citrus Exchange from Lee and DeSoto county locals are of a most encouraging nature and the outlook is far brighter than the most sanguine expectations anticipated. The sentiment favoring the exchange idea has grown steadily, day to day, until even the commission house representatives and fruit huyers have grown very respectful in their reference to its progress.

The growers who contracted frult at 50 cents for oranges are not so complaisant. Already they have seen prices hid up to 75 and 80

cents on the tree and can easily figure their lost profits. Consignment and joint-account arrangements have been far less in comparison with former years, and the growers still owning fruit, who have not joined one of the many local exchanges, now give this ultimatum: "Our price or into the exchange we go."

One of the most striking elements entering into the future certain success of the exchange is the sentiment of all its packing house managers for improved picking, packing and shipping methods. As one of them expresses it: "I'm going to pack my whole stock as if it was for exhibition at the state fair." There is friendly rivalry all along the line, each wishing to excel the other in turning out the most perfect package possible. This certainly strengthens the hands of the sales department greatly.

Their packing houses are being remodeled, improved and new devices added for preparing attractive fruit and packages. They are trying to see how well they can pack the fruit, first of all, and then utilize every economy compatible with this result.—Jacksonville Times Union.

## TREATMENT OF WOUNDS.

The argument in favor of dressing wounds caused by pruning is that it prevents decay and checks evaporation, both of which might interfere with the healing process. While in our arid climate the first is hardly applicable, the second should probably be doubly important. Yet, the matter of dressing wounds is not so important, but that work improperly done is worse than no treatment. A good lead paint is one of the most satisfactory dressings yet found. Rather a thick paint should be used, and careless daubing of the surrounding bark should be avoided. Grafting wax is a good dressing, but is rather expensive and difficult to apply. Other materials have been used, some successfully and some disastrously, and the grower is to be cautioned about experimenting; better stick to materials known to be safe and efficient. Growers often overdo the matter and waste time treating small wounds. Surely a wound less than one and one-half inches in diameter is not worth bothering with.

These suggestions apply to wounds made by the careless cultivator, as well as those made by the pruner. Unsightly wounds and permanent injury may often be avoided by proper treatment of trunk wounds. When the body of the tree is injured the ragged edges of the bark should be pared off to sound tissue and the whole injury covered with paint or grafting wax. If promptly done, this prevents drying out of the tissues, and new bark will readily form, except on parts where the outer wood cells are actually destroyed, and in time this will grow over. Wrapping the injury with cloth, or if it is near the ground, mounding earth up over it will often answer the same purpose.—Colorado Ag. Col. Bul. 139.

Willows has just added 1200 acres of land to a tract devoted to eucalyptus culture.

The Leonard Coates Nursery Company is shipping a quantity of eucalyptus trees, (E. Corynocalyx, or Sugar gum), to Mill Valley, whence they will be taken up Mt. Tamalpais, and will form the nucleus of a forest which Mr. Jas. Newlands, Jr., is engaged in planting on his land near the summit. It will add immensely to the beauty of that part of the mountain, and the trees will also be a great conservator of moisture.

The new officers of the California Educational and Co-operative Union elected last week at Fresno are as follows: President, W. H. Wrightson of Fowler; vice-president, S. M. Ingram of Kingsburg; secretary, B. M. Cook of Selma; treasurer, F. M. Wrighter of Santa Clara. The directors chosen were William Tyler of Imperial, L. J. Church of Santa Clara, J. H. Dawson of Hanford, E. M. Brandenstetter of Placer and V. D. Whitmore of Stanislaus.

**The Buying of Citrus Trees**

Is a Simple Problem in Economics

You cannot extract sunbeams from cucumbers, nor blood from stones, nor good crops of fine oranges and lemons from inferior trees. A poor tree is an expensive experiment entailing only vexation of spirit and a dwindling pocket book. Then why experiment with stock of doubtful quality? Why not get the best and be sure of the future? For 20 years we have been supplying the people who grow good citrus fruits with their trees in every citrus growing section of the world, and stand ready to serve you equally well. Why not write us and let us become better acquainted

The economics of successful orange and lemon growing is tersely explained in our book, entitled, "The Citrus Fruits: Historically, Horticulturally and Commercially," a copy of which is yours for the sum of 25 cents.

## STATE FRUIT GROWERS.

THE call for the Thirty-sixth State Fruit Growers Convention to be in Watsonville, December 7 to 10 has been sent out by the State Horticultural Commissioner. The Call says:

One of the most pleasing features is the place where this convention is to be held, Watsonville, the center of the beautiful Pajaro Valley, which ships yearly more apples than any other district or districts combined on the Pacific Coast. These apples, the Newtown Pippin and Bellefleur, which have made this valley famous, will be everywhere displayed, not only for inspection, but for sampling as well. Papers will also be presented on the subject of the apple in all its phases by representative men from the different sections of the Coast.

Of the other topics to be presented by paper and discussion some of the most important are: The leasing of our orchards and vineyards, its economic effect on the people and properties, and the closely related and ever significant farm labor problem. Our markets and transportation of our fruit will be discussed from every standpoint, from producer to consumer. Among these papers will be reports on transportation and storage experiments, pre-cooling, cooperation, distribution, grading and packing. The subject of a state highway will be presented.

One very important session will be devoted to health problems in rural life. This subject will be handled in a very pleasing manner and as it has never received consideration before will prove of unusual interest.

Other topics, such as the sulphur question, eucalyptus, fighting frost, almond, citrus, berries, and figs, will be presented by the best authorities on these questions.

## FRUIT GRADING. PACKING AND INSPECTION.

By J. T. Law, Loomis.

The meetings which have been held and the resolutions which have been passed about the grading, packing and marketing of fresh fruits incline one to doubt whether such subjects might not be much better discussed through the public press and where every one can read and ponder well at leisure in his own home the various schemes put forward. Probably there is no medium so convenient as the Cultivator for thrashing out and solving problems in which so many are deeply interested. Public meetings and resolutions may and should reasonably follow so as to decide by vote any points upon which men never unanimously agree.

But it seems like running the cart before the horse to pass resolutions and not consider them until afterwards, and this has evidently been done in regard to public packing houses. Resolutions more or less complicated were read, voted upon and passed at Newcastle and at Loomis which I do not believe were fully understood or considered by the bulk of the fruit growers present. Indeed it is doubtful whether half the speeches or half the resolutions were even heard by half in the meetings. Unfortunately people in enthusiastic meetings often take it for granted that all is right and vote as called upon without really knowing exactly what for. They may be actually surprised afterwards to read in the newspaper what they endorsed.

One particular resolution which I would refer to is that which calls for the establishment of public packing-houses, to which the growers must haul their fruit for sorting, grading packing, etc. I am told that this was passed unanimously, and yet I cannot find any one in this district in favor of such a scheme—excepting the party who introduced it. I have asked many and all have ridiculed the idea of hauling and jolting delicate fruits, full of bloom and color, in lug boxes, over rough roads, in dust and heat, to some distant public packing house. Surely more would be spoiled than packed.

It might suit very well a large grower, who has more fruit than he can manage, to have a public packing house erected in his orchard. It would be handy, also relieve him of much anxiety and expense in getting hands to do his work, but for the great majority of growers it will never do, and if persisted in may wreck the whole movement. Everybody agrees that a grading of the various sizes and official inspection will be good. Therefore, all that is needed is a simple plan providing an opportunity whereby every grower may have his fruit passed upon and stamped by an inspector.

Descending from the abstract to the concrete I would suggest that:

1. A responsible and certified inspector be appointed for each shipping house, whose duty it shall be to inspect and to pass or reject all the packed fruit submitted to him.

2. The inspector to be at liberty to select and engage any assistants he may need in busy times,—but the inspector to be responsible for the acts of his assistants.

3. The grower or owner of fruit to be at liberty to have all or only part of his fruit inspected, just as he pleases.

4. On arrival at a shipping house with his fruit the grower shall declare how many packages he wants inspected, and thereupon pay a charge of one cent per box on same. These charges may form a fund out of which the cost of inspection, etc., shall be paid.

5. The inspector with or without his assistants shall then proceed to examine the condition of the fruit, its ripeness, and whether graded according to standard marked on the box by the grower. He shall open as many boxes as he pleases. When satisfied that the fruit is right, he will stamp or label each box with the stamp or label adopted by the associated authorities, also marking thereon his own name or number of his certificate, so that if complaints came in from the East the inspector could easily be identified.

6. Fruit not submitted for inspection as also fruit rejected shall not be marked, stamped or labelled by the inspector, but shall be left to the grower or owner to sell, consign, can, dry or throw away as he chooses, and as he has been at liberty to do heretofore.

These arrangements would not interfere with horticultural commissioners nor shipping companies, so their assistance would not be necessary. I believe such a plan as this would be sufficient. Soon as growers see inspected fruit fetching 10 to 50 cents a box more than un-inspected they will quickly learn how to sort, grade and pack so as to get these higher prices.

There must not be any coercion attempted. And as to none but first class qualities of fruit being shipped, it must be remembered on the one hand that every man has more or less of faulty fruit every year which he could afford to sell cheaply, while on the other hand there are in our large cities crowds of poor people, men, women and children unable to pay high prices for highest qualities, but who are happy to buy slightly damaged fruit at a low price. A peach or a pear may have a bird peck, or a worm hole, and yet be an excellent fruit. To waste such would be a sin and a shame.

Growers may do well to think things over well, and then know how to vote on resolutions.

---

The raisin men of Fresno county have taken active steps to break up the prackers' trust which they assert exists, and an attorney has been instructed to take action against the combine on the ground that it is formed for the purpose of restraining the trade.

## THE ORIGINATOR OF THE CONCORD GRAPE.

EPHRAIM Wales Bull, who became famous as the originator of the Concord grape, died at his home in Concord, Mass., October 2, 1895. He was born in Boston, March 4, 1806. The last two years of his life he had been in the Home for the Aged. Mr. Bull, who lived on the road to Lexington for many years, developed the luscious Concord from the seeds of a grape that was found growing wild in 1840, near the village of Concord.

Mr. Bull received a good education and was working as a gold beater when disease of the lungs drove him to an open air life. He became an enthusiast in grape culture, but could not make any of the sweeter varieties thrive in the cool climate of the section mentioned. Even the Long Island grapevines perished there. Only the little acid varieties were hardy enough. But when he tasted the fruit of this wild vine he found it as he says, "foxy, but sweet," and was convinced that it would do. In 1843 he planted a lot of the grapes without breaking the skin, the seedlings of which he cultivated for six years, and in 1849 picked from them a few bunches of the original Concord grape.

Continued experiment and culture brought them to perfection, and now the fame of them has gone out into all the world. In France it has been recommended as the variety which is to replace old and diseased vines. From the Concord Mr. Bull developed other varieties, of which the best known are the Una and the Cottage. Mr. Bull was a member of the Massachusetts senate, member of the Social Circle,, and a very prominent Mason. He was a past master of Corinthian masonic lodge, of Concord. He was a man of very strong will, great thought, well read and versed in history. He was a member of the Board of Agriculture ten years, and was at one time a selectman. He desired to live until he could see his new grapes on the market. Some of the large New York vineyards have been cutting from them for the yast 14 years. One of these grapes he called Rockwood, after the latc Judge Hoar; another the Esther, for his father.

The old vine is attractive to many pilgrims who annually visit it. It is inclosed in a substantial trellis, and is kept quite free from grass and weeds. The house and grounds are in a well-kept condition, and a suitable monument to Mr. Bull will be erected. He "sowed that others might reap," and this is the sentiment on the bronze tablet on the native granite boulder at the head of his grave.

To the trellis has been attached a substantial oaken panel carrying the following inscription, cut by Mr. Bull himself in well formed letters. "I loked about to see what I could find among our wildings. The next thing to do was to find the best and earliest grape for seed, and this I found in an accidental seedling at the foot of the hill. The crop was abundant, ripe in August, and of very good quality for a wild grape. I sowed the seed in the autumn of 1843. Among them the Concord was the only one worth saving."—Green's Fruit Grower.

## CUCASA

Cucasa is a soluble saccharate of copper and lime, coming into use in Europe in place of the rather cumbersome Bordeaux Mixture. Such institutions and authorities as the Royal Institute of Viticulture and Horticulture, Geisenheim, Germany; the School for Viti- and Horticulture, Kreuznach, Germany; Comice Agricole, horticole et viticole, Besancon, France; Station Viticolc, Lausanne, Switzerland; and Mr. N. de Cock, Ath, Belgium; Mr. Louis Marchand, Port d'Ouvat, France; and Mr. F. Schwyzer-Honegger, Zurich, Switzerland, report favorably on its use.

Cucasa yields a solution of copper that has all the fungicidal propertles of Bordeaux Mixture, but with the added advantages of affording a clear solution in any dilution and of keeping comparatively long. Being a clear solution, it does not clog the nozzle of sprays; furthermore, much less of it need be used than of the Bordeaux Mixture, for efficient protection.

A solution of cucasa is uniformly alkaline; there can, therefore, be no copper sulphate present in it that would injure the foliage.

When sprayed on the trees, the thin layer of the solution is readily changed by the atmosphere, as in the case of Bordeaux Mixture, into the insoluble film of copper compound that has the specific power to kill fungi. The thinness of this film has the advantage of interfering all the less with the important functions of the foliage, and also of sticking very close—which was found in one case to be for three months after one spraying.

Cucasa consists of molecular proportions of copper sulphate, slaked lime, and cane sugar, thus being distinguished from other copper and sugar solutions by the proportions in which the constituents are present, in order to produce a clear, alkaline, fungicidal solution. Its inventor is Dr. C. Rumm, of Stuttgart, Germany.

It is put on the market ready for easy use, in packages to make a stated number of gallons of solution. —Merck's Report.

## THRIPS VS. COVER CROPS.

The question of thrips vs. cover crops was discussed at a session of Orchard City Grange recently and some new thoughts were advanced. It appears from experiments conducted by Mr. Dudley Moulton and also from experience of a number of fruitgrowers that plowing deeply and thoroughly in November or December after the soil has been wet either by rain or otherwise will effectually destroy enough thrips to practically insure a clean crop of prunes or other fruits. Many fruit growers have decided to try this remedy the present year, but a new condition now arises which will make it hard for some to do so.

Never in the history of fruit growing in this valley has so good a stand of alfilaria appeared as now. Where nettles and the almost as worthless Chinese lettuce have commonly occupied the ground, there is now more alfilaria and it has a good start. With ordinary rainfall a thick crop a foot high is assured by the last of February and with this prospect in view it will take nerve to plow it under when so small as to be of little use as a fertilizer. The question now arises, when is alfilaria in the best condition to contribute the most humus to the soil? It seems that little is known of this matter by the fruit growers generally, some contending that the best time to plow under a green crop is when it is still quite green and juicy, while others say that little or no humus will be aded to the soil at that stage of its growth. Some good, reliable information on this subject would be valuable to us all and interesting as well.

Can we not get this matter settled through the columns of the Cultivator?—Horace G. Kessling, San Jose.

## APHIS.

To destroy the aphis that attacks garden and ornamental plants, which is very likely to be the one that is damaging your cabbage, spray as soon as the insects appear with either kerosene emulsion or tobacco. To make the latter spray, use one pound of tobacco leaves to four gallons of water. Simmer one hour and then strain. Two pounds of tobacco dust or ground tobacco may be substituted for the leaves. To make kerosene emulsion, use two gallons of kerosene to a half pound of whale oil soap to one gallon of water. Dissolve the soap in water by boiling, and add the suds boiling hot to the kerosene away from the fire. The mixture is then agitated violently, preferably by pumping it violently back on itself with a force pump. After four or five minutes the mixture suddenly becomes creamy in substance. Use one gallon of the emulsion to 12 gallons of water in spraying.

# Malthoid Roofing

Mr. H. B. Eakins, of the Commercial Warehouse Co., Los Angeles, Cal., U. S. A., writes: "Now that we have had two good rains to test our Malthoid roof, we have desire to express our satisfaction in the knowledge that we have a covering over our head that does not leak. We write you regarding our pleasure in this matter from the fact that we had fully expected more or less trouble, as we did not believe it possible that so large a roof surface could be covered with any material and stand the test of a first rain, but there was not a leak due to defective roofing."

# Live Stock and Dairy

**Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.**

## FEEDING PROBLEMS.

By Mrs. M. E. Sherman.

AFTER a week up north of Fresno in the counties that are being rapidly developed into fruit and dairying, I come home more impressed than ever with the wonderful resources of the San Joaquin valley. The pumpkins and sweet potatoes of Turlock and the alfalfa fields around Modesto, the new country at Ceres with its fine creamery and dairy cattle, the great cannery at Atwater and the new pack of sweet potatoes in the dry form, all passed under review. I have enjoyed this week of Institutes, as everywhere I found readers of the Cultivator and uniformly appreciative words of the work it is doing for the California farmer and fruit grower.

### Corn.

The corn fields seen on this trip were uniformly good but planted too close together for heavy yields of corn. This mater of smallness and often of the lack of ears came up in several of the institutes. Corn is a grass and when too thick it is only fit to cut as fodder and is then to be considered a hay plant. At the Illinois Station in Bulletin 13, Professors Hunt and Morrow found that different degrees of closeness in planting gave the following results,

| Rows | Kernels to the Row | Good Ears Bu. | Poor Ears Bu. | Stover Lbs. | Grain Lbs. | Total Lbs. | Stover per acre Tons | Stover for each lb. Corn |
|---|---|---|---|---|---|---|---|---|
| 3 inches | .....47,520 | 13 | 46 | 3,968 | 2,250 | 6,218 | 4.8 | 3.6 |
| 6 inches | .....23,760 | 37 | 39 | 3,058 | 2,922 | 5,980 | 3.7 | 1.9 |
| 9 inches | -----15,840 | 55 | 22 | 2,562 | 2,977 | 5,539 | 3.1 | 1.5 |
| 12 inches | .....11,880 | 73 | 16 | 2,480 | 3,113 | 5,593 | 3.0 | 1.3 |
| 15 inches | ..... 9,504 | 63 | 11 | 2,398 | 2,782 | 5,180 | 2.9 | 1.4 |
| 24 inches | ..... 5,940 | 49 | 6 | 2,066 | 2,141 | 4,207 | 2.5 | 1.5 |

### Increase.

The increase in good corn ears is particularly marked as the distance increases, while the stover or corn hay decreases two-thirds, according to distance the grains are apart in the rows, yet the largest amount of good ears of corn came from the twelve inch plantings. In the matter of available nutriments more dry matter was secured from the corn crop when the entire plant was used from the three inch plantings. So that the dairyman if he regards the corn plant purely as a grass, gains most feed from the three inch plantings. The next question which arises is, does he gain enough to offset the difference in cost of seed? In the planting of the corn 12 inches apart in the rows there was 600 pounds less of available nutriment to an acre.

### Sugar.

The gain in available nutriment between the time of tasselling until the corn reaches the roasting ear stage is very rapid, then it drops off again.

| | | | | | | |
|---|---|---|---|---|---|---|
| July 30th | Tasselled | Glucose 58.3 lbs. | Sucrose 9.1 lb. | Starch 122.2 lb. |
| Aug. 9th | Silked | Glucose 300.4 lbs. | Sucrose 110.8 lb. | Starch 491.3 lb. |
| Aug. 21st. | In Milk | Glucose 665.0 lbs. | Sucrose 129.0 lb. | Starch 706.7 lb. |
| Sept. 7th | Glazed | Glucose 720.2 lbs. | Sucrose 95.1 lb. | Starch 1,735.0 lb. |
| Sept 23rd | Ripe | Glucose 538.4 lbs. | Sucrose 148.9 lb. | Starch 2,852.0 lb. |

The sugar and starch are developed at a late stage in the ripening and when this mature stage is reached, one pound of dry matter of well ripened corn plant has reached the highest nutritive value of the plant.

### Disappointments.

Many men plant corn and begin to cut it early and are greatly surprised that the cows do not increase the yield of milk on it. It is then very watery and will not give at all large returns any more than the early grasses of the spring time will give it. The silo gives us a chance to preserve the corn crop at its best by taking it at its highest nutritive value and holding it there at its best for feeding.

### Sorghum.

This plant affords a convenient form of green food for cutting and soiling during a long period, as it will grow up again after it has been once cut from the stalk. Seeds from the saccharine varieties are not much used for feed. The yield is not great enough when compared to that of Indian corn. Three-quarters of a ton of seed to the acre is about the average yield of seeds. The fodder or hay is rich in value. The dry matter in 100 pounds is 87.2 available matter; digestible protein 7 pounds, carbohydrates 52.1, ether extract 3.1. Sorghum is a dry or arid land plant and will produce a crop on a limited allowance of water. Corn requires a much larger amount of water to make a growth. If corn is once stunted from want of abundant water it will rarely recover and make a full yield. Sorghum will stand still without drying out for a long time and when watered starts to grow without showing the stunted effects of the drought. —M. E. Sherman.

## WHY SOWS GO DRY.

In the first place we hold the opinion that there is more money in raising eight or nine pigs from a sow than there is in raising a larger number. We have seen men go into ecstasies over the fact that one of their sows had farrowed 12 to 14 pigs, and they would start in with the whole number and expect to take them through successfully to the weaning time. While we do not say that it cannot be done, we do say that it cannot be done successfully in the great majority of cases. With those breeds that are prolific the right thing to do is to kill the little fellows that seem to have the poorest place on the udder. This can be determined in a very few days, and if this plan is carried out it may prevent the trouble. In the case of a gilt, seven or at the outside eight pigs are all that she has any business with. Sometimes with gilts and with old sows there will be one or two teats that are not well developed. Just as soon as a little pig finds out that he is starving to death he starts in to use his tusks in earnest, and as a result you have black eyes, sore cheeks and, in the end, you will have a sow with a sore udder, because the last thing that a pig will do is to let go his hold when a neighbor pig undertakes to jostle him. He will hold on, not only with his lips, but after so long a time with his teeth, and every man who has raised hogs knows what the result will be. The old sow will be on her feet in an instant, and later on, when the pigs get busy again and another fight for position ensues, the sow goes through the same performance. In a few days the result of this will be that the sow will shut off the whole milk supply and then you have on your hands a starved litter. It never pays to hesitate about killing a pig right on the spot

**TIME TO BUY CREAM SEPARATORS NOW**

There never was a better time to buy the best of Cream Separators than right now.

The advantages derived from the use of the good Cream Separator are greater in the fall and winter than at any other time,—when the cows are old in lactation, the loss of butter-fat is otherwise greatest, and butter prices are highest.

Likewise are the advantages of the superior DE LAVAL separator greatest over imitating separators when the milk is hard to separate and the weather cold and variable.

In every case a DE LAVAL separator, of suitable size, will surely at least save its cost between now and July 1st next, and go on returning 100% per year on the investment for twenty years to come.

The agricultural and particularly the dairying outlook was never brighter and more promising.

*M. Bassett* *Hanford, Cal.*

if you find out that his part of the udder hasn't developed properly. He will be a runt if you get him through and he will do his best to runt the others.

Men differ in their opinion as to the necessity of removing the little tusks. It may do no harm to cut them off, but we will say that as the result of long experience we have not found is necessary to do so. If the sow is fed well, so that she has plenty of milk for her pigs, there will not be any trouble, only of course when the litters are mixed and you then have a plan of systematic stealing. When that program is started there is no such thing as raising a uniform bunch of pigs, and that is why we have always advocated the practice of keeping each sow and her litter separate until such time as the little pigs know their own dam.

Generally it is not practicable to have more than two sows in the same lot together when the pigs are young, because if the number is increased the little pigs get confused and often start in at the wrong place.

Of course feeding may have considerable to do with a sow drying up when her pigs are three weeks old. At that time she ought to be getting about all the good, rich slop that she will consume twice a day, and this should not be composed wholly of corn. If corn is used, add one part of oil meal to eight parts of corn or one part of tankage to 12 parts of corn. A mixture of ground corn and shorts makes a very satisfactory slop, but, as said before, let the old sow have an abundance of it, especially if she has a large litter, because at no time in the life of a pig can as cheap gains be made as when it is sucking.—Iowa Homestead.

### READ AND HEED.

Don't forget that charcoal is good for the hogs, salt also. Have it where they can help themselves.

Often pigs lack in vigor because the brood sows are kept too fat.

A good thrifty condition is much better for the pig than too much fat.

Good treatment is seen in hogs quicker than in almost any other animal when an increase of feed or care is made.

---

It is much the best economy to furnish swine a grain ration when they are on pasture, as it results in better gains and a better product. One man estimates that it takes from one-half to one-third less corn on alfalfa pasture than on a straight grain ration to make a hog ready for market. Many let the hogs run on alfalfa until about five to six months old, by which time they reach a weight of 75 to 125 pounds, feeding just a little grain; then they feed heavily for about two months and sell the hogs at eight months old weighing 200 to 225 pounds. One farmer, who raises about a thousand hogs a year and who in one year sold $11,200 worth, makes a practice of growing his hogs on alfalfa pasture until about eight months old, feeding one ear of corn per head daily. He then feeds heavily on corn for a month or two and sells at an average weight of 200 to 225 pounds. Another man feeds all the corn and slop the pigs will clean up, all the while grazing them on alfalfa pasture, and sells at six to eight months old at weights of 250 to 300 pounds. Another, who raises about a thousand head a year, feeds all the corn the pigs will eat, beginning shortly after weaning and continuing until the hogs are sold at ten to eleven months old, averaging about 275 pounds.

Another farmer, from weaning time (two months old) until eight months old, feeds the pigs nothing but dry corn on alfalfa pasture, averaging about one-half gallon of corn (3½ pounds) a day per head. At the end of eight months he sells at an average weight of 250 pounds.—From Coburn's "Swine in America."

---

"The National Association of Live Stock Breeders and Raisers will hold their annual Convention on December 2d, in hall over Drover's Deposit National Bank, Stock Yards, Chicago. The subject of appointing a strong Committee to go before Congress and urge a liberal appropriation for the Department of Agriculture and Bureau of Animal Industry, for the purpose of preventing and eradicating Tuberculosis, Hog Cholera and Plague, Anthrax, Sheep Scabies, Ticks, etc., will be agitated.

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

**Out They Go**

Some farmers and dairymen first buy disk lilled or other common cream separators—use them a while—discover they are not modern—then out they go for Sharples Dairy Tubulars.

That is paying dear for experience—but is better than continuing to use common separators. This is proved by the fact that Tubulars probably replace more common separators every year than any maker of such machines sells.

The only piece used in Dairy Tubular bowls.

Sharples Dairy Tubular

Other farmers and dairymen look more carefully into the subject. They talk with Tubular users. They convince themselves that Tubulars are the only modern separators—The World's Best—and buy Tubulars in the first place.

Tubulars are made in the world's biggest separator factory by the oldest separator concern in America. Branch factories in Canada and Germany. Sales easily exceed most, if not all, others combined.

**A Million Farmers Back Your Judgment When You Buy PAGE WOVEN WIRE FENCE**

The verdict of a million farmers—the men "on the other side of the fence"—unanimously concedes supremacy to "PAGE." The Pioneer of Woven Wire Fences has been tested by a **quarter of a century of field service.** It has the backing of a vast army of fence users, whose opinions are summed up in thousands of letters like these:

Page Woven Wire Fence Co., Adrian, Mich. West Unity, Ohio.

Dear Sirs:—I thought I would send for your price list of Page Fence. I have had 100 rods of the Page Fence up for ten years and it is good yet, and would like to get some more and want you to send the price list as soon as possible.

Yours truly, JOHN MARZOLF.

Page Woven Wire Fence Co., Adrian, Mich. Union City, Mich.

Dear Sirs:—Please send me price list of 1258 stock fence. I have the first Page Fence put up in Union township. It was about 24 years ago that it was built, and is a good fence today. I have built about a mile of Page Fence since, 1258 and 2058 heft. There is no agent here at present, and I believe there could be a large sale in this locality if it was worked just a little, for it is the best fence on earth.

Lock Box 11. Yours truly, GEORGE E. ROE.

Page Woven Wire Fence Co., Adrian, Mich. White River, Vermont.

Gentlemen:—Some five years ago I bought of you some woven wire fence. This was sent to me at Wilder, Vt. The fence has given excellent satisfaction, and to the best of my knowledge nothing bigger than a cat has ever gone through it. Where can I get more, and can I be sure of prompt shipments? Will you send me prices and descriptions? I am especially interested in a hog fence. Yours truly, C. D. HAZEN, Jr.

## CUT WORMS REMEDY.

As a rule, cut worms are a small factor at this season of the year, but even now they are occasionally troublesome. A vigorous campaign is necessary where perfect control is desired.

In the whole list of remedies for insect pests, the poisoned bran mash has been one of the most effective, and it is to be regretted that such a cheap, easily applied and successful treatment as it has proved to be, is not more generally used. In order to get the best resuts from the use of this bait, the following precautions in preparing and applying it should be observed:

Procure a bushel box or large soap box and place 25 lbs. of bran in it. Molsten with half a pail of water thoroughly diffusing the moisture throughout the bran. It is better to have the bran under moistened rather than over moistened. Dissolve 3 pounds of sugar in half a pail of water and add this in the same way. The right amount of water has been added when the bran is moist enough to cause the fine particles of Paris green to adhere to it and when it crumbles easily and runs through the fingers without adhering. Now take ½ pound of Paris green and dust a portion of it over the surface of the bran. Stir the bran thoroughly. Repeat this process until the whole ½ pound of Paris green is thoroughly disseminated through the 25 pounds of bran. If the Paris green is added to perfectly dry bran, owing to its weight it will sink at once to the bottom when stirred, in the same way that it does in water. Until ready to use, place the mixture in a cool shaded spot. The land upon which the crop is to be grown should be kept free from all vegetation for two or three weeks previous to planting. This renders the cutworms hungry, and they will eagerly attack the poisoned bait when it is applied. The bait should not be applied till after the sun goes down. If applied in the day time, the heat of the sun dries out the mixture, and it loses some of its sweetness and its not so attractive. The first application should be made in the evening of the day the plants are set out and subsequent applications during the next few days at the grower's judgement. When applying, sprinkle just a little close to the stock of each plant. Fifty pounds of bran with one pound of Paris green thoroughly sweetened and prepared as above described, will cover one acre and can be applied in two hours, so that this remedy is much cheaper and more satisfactory than resetting. Wherever a plant is cut off, the worm is sure to be quite near the root and should be dug out and destroyed. Clean farming will also help by destroying many eggs and preventing the deposition of others.

## THE VITALITY OF SEEDS.

I have several books on gardening which contain tables purporting to give the vitality of seeds under average favorable conditions. Theoretically, such tables are very useful. If a quantity of seed is left over one year, it looks like a shame to discard it and buy new seed. But while I haven't made very close observations—have no records to prove my belief—I've come to the conclusion that there are very few cases in which it pays to use old seeds. Even when the old seeds germinate freely the difference in vigor of growth in favor of fresh seeds seems to me to much more than offset the value of the seeds discarded.

My observations, however, may be at fault through error in regard to the age of seeds purchased, for I don't know how old they may have been when I got them. The seedman may have consulted the vitallty tables before me.

The one vegetable that in my experience age of seeds has made the least difference with, is the beet. I used last season the last of two lots of beet seed from which I had sowed some each year for four years, and the seed was apparently as good as the first year. Radishes from seed known to be three or more years old have grown more slowly with me than when the same seed was fresher. Cabbage is supposed to be safe for four or five years, but I never get good plants from seed I have had that long. I've tried a number of little remnants just to see.—Ex.

## POTATO BLIGHT.

There are two blights, or fungous diseases, which affect potatoes in all sections almost every season; one is the early blight and the other is the late blight. When potato plants seem to stop growing for no apparent cause, or the foliage becomes brown or spotted, the trouble can safely be laid to the blight. It has become so common and wldespread that in most sections the annual potato crop is reduced fully 50 per cent.

Potato blight, however, can easily be controlled if taken in time, and a full crop of tubers will result. Begin early and spray the vines every two or three weeks with the well known Bordeaux mixture. In many localities potato growers have nearly doubled their crop by frequent spraying with this mixture.

The late potato blight is also responsible for wet rot of tubers in the bin. Its progress on stored potatoes is checked by dusting them with air-slacked lime. The cost of spraying potatoes is about one dollar per acre, and the gain from five to six sprayings amounts to an average of about $25 per acre. When potatoes are thoroughly sprayed they not only produce much more of superior tubers but the tubers are less liable to rot and future infection of the potato soil is reduced.—Journal of Agriculture.

## CARE OF STRAWBERRY PLANTS BEFORE SETTING.

It is very often the case that plants are received several days before the ground is ready for setting. Since the plants come tied in bundles and packed in damp moss it is very necessary that they be opened and spread out to prevent molding. The only safe and economical way is to heel them in. Select a well-drained piece of land, remove the trash, if any, and spade up deeply. Level off the soil and cut a trench deep enough to admit the roots without doubling up. One side of the trench should be nearly perpendicular. Lay the plants on the perpendicular side of the trench so that all of the root system comes below the surface, but not so deep that the crowns may be covered. In the latter instance the crowns will rot if allowed to remain in the ground for any length of time. Spread out the roots and place the plants so that they barely touch. Fill up the trench with fine soil and pack down firmly with the foot. Be sure there are no air spaces left among the roots. Be sure that the roots do not extend above the ground. If there is any danger of the plants freezing, cover over with a light coating of straw. Do not put it on very deep as the plants are liable to be smothered.

Vining beans and all other vines should have pole or similar mechanical supports. Some plant corn or sunflowers for beans to vine on. This is the "lazy gardener's" method. Two thrifty plants cannot occupy the same soil space at the same time and thrive. Plant corn and sunflowers by themselves and beans by themselves and give the beans good pole support if you wish to secure a big crop of beans.

No seedsman can afford to sell good seed at a low price. Pay a good price and get good goods. This is imperative for success in garden work.

Send for Catalogue. Please mention Cultivator

# Trees Eucalyptus Trees

For fall and early spring planting. Our interior valley climatic conditions make hardy plants. Best to ship. Best to plant. Our trees grow. Prices right.

**The Southard Nurseries**
Redlands, Cal.

The Oxnard sugar factory has just closed its seasons run on the highest grade beets ever.

# Trees and Seeds

## THAT GROW

For 24 years we have supplied our customers in all States with Trees and Seeds that GROW. We carry a most complete line of **Fruit and Ornamental Trees, Berry Bushes, Roses, Perennials, Bulbs, etc.** Low prices. Best quality stock only. Pacific States varieties of Apples, best one year trees at $6.00 per 100. Peaches $5.00 per 100. We pay freight on $10.00 orders.

Also, very large and complete stock of **Farm, Vegetable and Flower Seeds** to select from. Write for big 112 page catalogue and Garden Book. Mailed FREE to anyone interested; also, free sample packet of "New Coreless" Tomato, the best of all tomatoes.

**GERMAN NURSERIES AND SEED HOUSE.**
**Box 54, Beatrice, Neb.**

## Strawberry Plants

**Bred in California**

Will yield more berries, and have fewer runners than eastern stock. Breeding plants carefully selected each year and not allowed to fruit.

### Superb--Everbearing

We have Brandywines, Jessie, Marshall, Burbank Beauty, Excelsior, Enhance or A1, Lady Thompson, Klondike, Mrs. Miller, Hummer, August Luther, Commonwealth and Pride of Cumberland.

Send Stamp for our elegant new catalogue containing description, prices and cultural directions.

**G. H. Hopkins & Son**
**BURBANK, CAL.**

## Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon application.

**Theodore Payne**
SEEDSMAN and NURSERYMAN
**345 So. Main Street**
**Los Angeles, Cal.**

## 20,000 Superlative Raspberry Plants

The Largest Raspberry in Cultivation. Sure Cropper.

### 600 Grafted Franquette Walnut Trees

From selected trees of the Vrooman Strain on black native root.

**Wm. RICHARD,** 438 River Street, Santa Cruz, Cal.

## 350,000 Asparagus Plants

Barr's Mammoth, Conover's Colossal, Columbian Mammoth White and Palmetto. 1-year-old plants grown from finest seed obtainable, $1.00 per 100, $5.00 per 1,000, cash, express prepaid. Delivery in December, order now. Special rates on large quantities. Correspondence solicited.

**Otto F. Schuchard**
362 East Lake Ave. Watsonville, Cal.

## EUCALYPTUS
**TREES AND SEED**
**SUNSET HORTICULTURAL COMPANY**
**Inglewood, California**

# Ornamental

### A SMILE FACTORY.

THE following which is from the Sunday School Times applies to California—applies to the whole world. May we not have more "smile factories?"

Come and go out to the front yard gate with me and see me make some smiles. They are very fine, and yet are inexpensive and very easily made.

I'll tell you how I do it. In November, when my neighbor pruned her fine roses, I took forty-eight of the cuttings and put them in the ground just where I wished them to grow, with a handful of clean sand about the lower end. Over each was put a glass fruit jar, hilling up the earth about these protectors. These were left on through the winter and until the spring was well advanced. Then I had forty-three small rose-bushes which, with a little cultivation, grew rapidly and soon began to bloom.

Now the smile factory is ready. I go out near the front gate, where the roses are in a row along the drive, and wait for some one to fit a smile on. Judging from what I hear them say, the girls must have considerable trouble fitting their frocks. But I never fail to fit a fine smile on any one—fat,, lean, tall, short, old or young—the very first trial.

Here come two bright girls on their way to school. "Take your choice," I call, as I hold up an American Beauty and a La France. Each pins one on her shift-waist, and, with a hearty "Thank you, thank you," they trip away wearing two smiles that would grace a queen.

Next a young man comes spinning by on his bicycle, I hold up a fine bud, with a beckoning motion. Of course he stops, and I give him the bud with a pin to fasten it on the lapel of his coat. The smile he carries away is a becoming companion for the lovely rose-bud.

An old "black mammy" has been down town to deliver the week's washing to several families. The black face looks tired and sad. "Mammy, let me give you these two big red roses." "Oh, thank you. Ain't they sweet?" And, with a courtesy, she goes on, the dear old motherly face illumined with a smile that is good to see.

Toward evening a railroad laborer passes with empty dinner-pail, going home. "Take these to the wife," and I hand him a bunch of beauties. A smile lights up the toil-hardened face, and the step is sprightlier as he goes on down the track.

"Would you like this to wear?" And, as the little daughter of Ham goes on her way, a smile has transformed her into an ebony cherub.

And so I may, and so I will, go on indefinitely making smiles that suggest that land where there shall be no tears. And every time I fit one of the new-made smiles on another's face I feel one playing over my own face.

Does my smile factory pay? Indeed it does; pays big dividends. Start one yourself; not much capital is necessary. And, judging from the sober, sad, grief-drawn, toil-hardened and care-worn faces, there are not now nearly enough smiles made to go around.

Every day I pass a yard, at a street crossing, that is radiant with roses, and none of them are ever cut. I wish I could have it for a few weeks at least; I'd establish in the corner, where so many smile-less people pass, a free smile dispensary. And as long as the roses lasted, that should be the most smileful street-corner in town.

---

Concrete is now used to make all kinds of garden accessories. It is practically indestructible and the color of this material in its natural grade cement is most pleasing and blends with out-of-door surroundings better than marble or newly cut stone.

---

Forest fires did great damage near Bisbee, Arizona, last week.

## Rex Lime and Sulphur Solution

### The Famous Insecticide and Fungicide

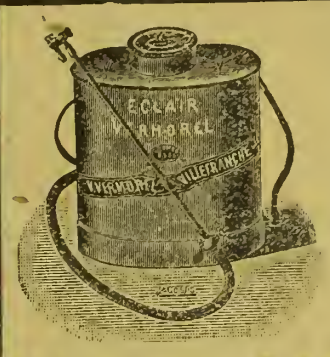
It has been found that Rex Lime & Sulphur Solution used in the early part of the season is as effective for Blight as the Bordeaux Mixture, and it does not have the injurious effect upon the tree as Blue-Stone. In Oregon and Washington the use of Bordeaux is being entirely eliminated and lime and sulphur solution used for all purposes. The leaves are falling from the trees, and especially the Peach, Almond and Apricot should be immediately sprayed for the first spraying. The second spraying should be done on all trees just before the buds open in the Spring.

Rex Lime & Sulphur Solution is a guaranteed article; properly prepared; free from sediment, and as cheap, if not cheaper, than the farmer can make a mixture himself.

For particulars inquire of your dealer or write to the factory at

**BENICIA, CALIFORNIA**

**CALIFORNIA REX SPRAY CO.**



## Vermorels Eclair

### Liquid Sprayer

Has diaphragm pump and throws the strongest spray. Write for description.

**Vermorels Liquid and Powder Sprayers** greatly excel all others.

**The H. C. Shaw Co.**
General Agents **Stockton, Cal.**

## ALFALFA

Fresh crop seed absolutely pure and high germination. Ask for our prices on your wants. This seed is sure to advance in price very soon and early orders will save you money.

Plant **Yellow Danver** and **Australian Brown Onions** for early spring crops.

## EUCALYPTUS

Get our prices on Trees and your requirements of seed for next season.

We have a fine stock of trees—all leading varieties.

## SWEET PEAS

Get our catalogue describing 80 varieties of the select kinds for now.

Mixed orchid flowering. Pkg. 5c, 10c an oz., lb. 60c., post paid.

**Send for Our Catalogue**

**MORRIS & SNOW SEED CO.** 425 So. Main Street Los Angeles, Cal.

## Eucalyptus Trees for Fall Planting

It has been demonstrated in the San Joaquin Valley that the best time to plant Eucalyptus trees is about the first of November, or as soon as the rains have thoroughly soaked the soil.

We have 200,000 trees of various varieties just the proper size for fall planting. We would advise that you place your order early, as there are very few trees to be had at this time of the year.

**Aggeler & Musser Seed Co.**
**113-115 N. Main St., Los Angeles**

## Strawberry Plants

My plants are all grown in Tropico and on land never before used for Strawberry Culture. Plants are selected by myself for breeding and the blossoms always picked, therefore the strength grows into new plants. This is why my stock will produce by far the greatest amount of berries. If you are going to set out 100 or 500,000 be sure and write to

**E. H. LEARNED** **R. F. D. No. 5, Los Angeles**

Grower of Strawberry Plants only, and only the best.

## Contents

RESERVOIR SITES OF TURLOCK-MODESTO IRRIGATION DISTRICT, Cover.

GOOD OPPORTUNITIES FOR DAIRYMEN IN CALIFORNIA, 515.

CITRUS AND SUB-TROPICAL FRUITS.—Thoroughness in Pomology; Black Scale and Nightshade; Cover Crops; In Florida; Treatment of Wounds, 516, 517.

DECIDUOUS.—State Fruit Growers' Convention; Fruit Grading, Packing and Inspection; The Originator of the Concord Grape; Cucasa; Thrips vs. Cover Crops; Aphis, 518, 519.

LIVE STOCK AND DAIRY.—Feeding Problems; Why Sows Go Dry; Read and Heed, 520, 521.

SMALL FRUITS AND VEGETABLES.—Cut Worms Remedy; The Vitality of Seeds; Potato Blight; Care of Strawberry Plants Before Setting, 522.

ORNAMENTAL GARDEN.—The Smile Factory, 523.

EDITORIAL—Exhibits at Conventions; Grow the Best; Get a Lesson; Settled a Lawsuit; Cotton; Looking to the Future, 524.

AGRICULTURAL NOTES OF THE PACIFIC COAST, Northern, Central, Southern, The Coast, 525.

POULTRY.—Chicken Pox; Roup; Chicken's Comb, 526. 527.

FORESTRY.—Drainage of Irrigated Lands in San Joaquin Valley, 528, 529.

QUERIES AND REPLIES.—Frost Bitten Sorghum; Oat Hay for Milk Flow; Grafting Walnuts; Inoculating Alfalfa Seed; Black Knot of Vines; Cow Peas; Milch Goats, 530, 531.

HOUSEHOLD.—Mission Bells of Monterey; When Hiram Got Mad; Care of Glass and China; The Yellow Jacket, 532, 533.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 534, 535.

## Exhibits at Conventions.

WE NOTE that the Oregon State Horticultural Society which will meet in Portand the week of December 5th, will make extensive exhibits of horticultural products for which cash premiums will be offered. In looking over the premium list we find many $25 and $50 cash premiums offered and a great number of $10 premiums. The best five boxes of apples captures $50, and there are several $50 premiums for single county exhibits. The best exhibit of 25 pounds of walnuts will receive $20.

The idea of mentioning this at this time is to suggest that such an exhibit as will be brought together by these 125 premiums offered by the horticultural society will have more educative effect than several days' discussion of abstract questions. There is too much offering of resolutions and discussing of questions without reaching definite conclusions. The newspapers and magazines appreciate the fact that education is quicker and more lasting when it comes through the eye rather than the ear. Therefore, vast numbers of engravings appear in every issue. Exhibits of fruit show the same results. A magnificent showing at once stirs the curiosity to know the where and the how of such production. We believe that our state conventions could well take suggestions from the Oregon plan.

## Growing the Best.

A PROMINENT GROWER of walnuts who was recently in the Cultivator office, in referring to grafting over his English walnut trees, said that while he had recently grafted a large proportion of his orchard and the trees were very greatly reduced as to size of top, yet his orchard was producing two-thirds more nuts than before cutting off the tops of the trees. This was due in a very slight degree to increase in size of the trees which had not been cut back, but more largely to the young grafts coming into bearing. These newly grafted trees were producing far more the second year after grafting than had the entire tree tops before. His cost of cultivation, irrigation and fertilization, and other items of expense were in no way increased. The orchard was cultivated no more intensively. When these grafts come into full bearing, it may be imagined that the increase will be vastly more than appears at the present time.

The orchardist often works week in and week out, and even year in and year out, caring for trees which will never bear a full crop. Trees are like men; they are good, bad and indifferent, and the sooner the orchardist realizes which are the bad and indifferent ones and replaces them with something which produces more, the sooner he will receive proper returns from his ranch. An unproductive tree in the middle of the ranch costs exactly as much to cultivate and irrigate as does a good one.

## Get a Lesson.

TALKING WITH PROF. CLARKE a few days ago about the great good the University is doing the farmers in conducting these institutes, he remarked that one incredible feature of all such efforts was that so many farmers took away no lessons from these meetings. It is hard to conceive how a farmer can attend with eyes so closed as not to take away at least one lesson which will help him to produce better fruit. Possibly this is due to indifference, but more largely to the old lingering feeling of many practical farmers that "book farming" is to be looked down upon. But scientific men who have delved into the mysteries of nature have something to give our hard working practical farmers. The book farmer might possibly not be a success when it came to working on the farm, but he has information which will help to make the work easier and more profitable. Let every farmer go to these meetings with his eyes and ears open, prepared to carry home, not only one,but many lessons.

## Settled a Lawsuit.

THE SETTLEMENT of the lawsuit between the Anderson-Barngrover Co. and the walnut growers of Southern California has been a very wise step. The growers were convinced that they had a strong case and could win out in the supreme court, but when the owners of the patent dipping process showed an inclination to accept a reasonable compensation, the growers promptly paid up, and instead of fighting the case, which would have required some little funds and much time and exasperation, settled the entire matter on the payment of $10,000. The process now used by walnut men generally in bleaching walnuts is the electrical process and does not infringe upon this patent, so that the chloride of lime process will no more be used.

## Cotton.

SPEAKING OF THE PRONENESS of Californians to go to extremes in the planting of one variety of fruit or particular product, a prominent grower recently referred to the situation in Imperial Valley. At the present moment the entire valley seems filled with the idea that cotton is the one great staple which will bring it wealth. A few months ago it was feared that the production per acre would be so low and expense of gathering so high that the experimental planting would result in failure. But the crop has been gathered and much of it marketed at a fair price. Now the air is full of cotton and the question is whether or not the whole valley is to be turned into a cotton field.

Attention may be called to the fact that in the same valley this fever has had various manifestations in the form of grape planting, date palm planting and cantaloupe planting. The cantaloupes made much money for those who first engaged in the business, but the prevailing idea that if a little was good much would be better, ruined the industry, so that few made anything from it in the last two years. Very probably the industry will be put upon a better basis and prove most profitable again. No doubt the same will be true of cotton, but if it is boomed and boosted to such an extent that all kinds of people rush into cotton raising with large expectations of profit but small understanding of the industry, the Valley will be seriously injured. Level headed growers should endeavor to keep a steady hand on these industries and not permit wild statements to carry people off their feet.

## Looking to the Future.

THE TURLOCK IRRIGATION DISTRICT is one of the big irrigation schemes of California which has emphatically made good. In this district are over 176,210 acres of San Joaquin Valley soil whose fertility was not realized until the introduction of irrigating water diverted from the Tuolumne river by the great La Grange dam. This dam does not store the storm waters at all, being merely a diversion dam. The owners of these lands who are also the owners of these great water rights are now realizing the necessity of insuring a more permanent flow and as the section becomes more thickly settled the demand becomes more insistent. The Turlock Journal has taken up the matter and is urging the securing of reservoir sites at certain locations where dams may be constructed to store great bodies of water. Corporations and great interests are doing their best to control these waters. The people must awake, and the Turlock-Modesto owners have begun none too soon.

## Opportunities for Dairying.

(Continued from Page 515.)

selected sires of known heavy producing ancestry goes on increasing and intensifying the improvement of his herd from generation to generation. In this way the sire becomes one-half, three-fourths, seven-eighths, fifteen-sixteenths, etc., in a few years the sire is practically the whole thing when improvement is considered. It can readily be seen that a good pure bred sire that can add from $10 to $50 to each of his daughters in producing capacity and actual selling value becomes the most valuable animal on the farm for the reason that he makes his owner the most money. It is neither unreasonable nor impossible for a good pure-bred sire to increase the average value of his daughters $25 each and he could easily sire fifty heifers during the year which would make his year's work amount to $1250 and in six years $7500 in increased producing capacity and selling value of his daughters to say nothing of his grand-daughters and great-granddaughters, which if taken into consideration would probably increase the value of his influence for good to twice that amount. It is impossible to estimate the value of a good pure-bred sire in a dairy herd, and the improved dairy bull that can transmit heavy producing qualities of his ancestry to his offspring affords an opportunity to increase the profits of the dairy business more than any other one thing. Creamerymen above all others should bear this in mind and act accordingly.

The development of irrigation by storing water in immense reservoirs in the mountains, the diverting of water from streams that formerly flowed into the sea, the better understanding of sinking and developing pumping wells, the perfecting of pumping plants, the securing of successful artesian wells by going to greater depths, the more economical and scientific use of irrigating waters, the cutting up of large bodies of land into subdivisions and providing therefore a necessary and adequate water supply, the distribution of irrigating waters over large tracts of semi-arid land suitable for the production of alfalfa, the securing of improved pure bred dairy sires, these together with a climate that is marvelous and with the best markets in the world, provide us with unparalleled opportunities for dairying in California.

# Agricultural News Notes of the Pacific Coast

## Northern California

Grape shipping has been finished at Lodi.

Sutter county orchardists are already pruning.

Large new acreage of hops is being planted at Wheatland.

An irrigation ditch at Sunset, Sutter county, will be extended to Terra Buena.

The Sonoma County Poultry Cooperative Association held its annual election in Santa Rosa last Saturday.

Sacramento county has formed a Board of Forestry which will have charge of tree planting along the roadways.

The area of national forests in Shasta county is 509,972 acres. Tehama county's forest reserves aggregate 558,720 acres.

Tehama county is shipping olives to Southern California for pickling purposes, one company having purchased over $32,000 worth.

The supervisors of Contra Costa county are directing a warfare on squirrels many of which are known to be infected with bubonic plague.

Yuba City fruit growers are endeavoring to have the California Debris Commission take action looking toward having the brush cleared from the Yuba river.

The fruit growers of Solano and Yolo counties held a most successful meeting at Vacaville to discuss matters very much along the line taken up by Placer county growers.

The cider works at Eureka is receiving about a carload of apples a day for the manufacture of vinegar. Windfalls and other cull apples are being bought for five dollars per ton.

No other state fared so well as did California at the A-Y-P Exposition. Over 800 awards were made to exhibitors from this state which is said to be more than to all other states combined.

This season's shipments of deciduous fruits from Northern California beat all former shipments by over 2000 cars. The total was 14,688 carloads. This does not include citrus fruits nor apples.

The trustees of Oroville have applied to the United States Circuit Court for injunction against the Ophir Gold Dredging Co. to prevent the using the of a certain strip of land near the city.

The Committee of Fifteen appointed at the Loomis meeting of the Placer county fruit growers met at Newcastle on Saturday the 13th and called for a meeting of the entire convention to be held at Newcastle on November 22nd.

A meeting of the River Advisory Board of the State Engineering Board, called a meeting of land owners at Sacramento for November 22nd to take steps to secure from Congress an appropriation of $400,000 to match a like appropriation from this state for the purpose of acquirement of land at the mouth of the Sacramento river and widening and deepening its channel.

## Central California

A bunch of wild turkeys has been liberated in the Sequoia National Park.

Pajaro Valley is shipping a hundred to a hundred and fifty cars of apples weekly.

Exeter, Fresno county, claims $500 an acre net returns from Valencia oranges.

Modesto's farmers institute last week passed resolutions calling for better roads.

The acreage planted to beans in San Joaquin county will be greatly increased another year.

San Joaquin county bean growers report a slight shortage in crop this year but very high quality.

The annual convention of the California Creamery Operators Association is being held in Porterville this week.

The Delano Record says that the new creamery of the Delano Creamery Co. will be a model institution of its kind.

Corcoran is extending its agricultural field by growing cotton and has produced some very fine specimens this year.

A new deep well pump has been invented by a Delano irrigator, which is said to be a wonder of efficiency and economy.

Turlock farmers held a valuable institute conducted by W. R. McIntosh, Mrs. Sherman making the principal adresses.

Melon growers have been so dissatisfied with returns made by the farmers union that the officers of the union have requested that the books be audited by experts.

Madera county farmers are continuing the fight against ground squirrels and the county board of supervisors are distributing large quantities of poisoned grain at cost.

The Corcoran Alfalfa Association with 2000 acres of flat lake bottom land, is throwing up a levee fifty feet wide at the base and about ten feet high to protect its land from flood waters.

The horticultural commissioner of Fresno county reports an infestation of the citrus mealy bug which it has been exceedingly hard to control. The natural enemy of the parasite which has been introduced does not seem able to stand the climate.

Heavy white frost visited various sections of the San Joaquin Valley on the morning of the 15th. The average of temperature was not low, but the atmospheric conditions were such as to give a white frost with almost the appearance of a snowstorm.

The Cultivator stated last week that "Citrus growers in Kern county are alarmed at the discovery of red scale at Bakersfield, Kern and Delano," which information was secured from a San Joaquin valley paper, but which report we are now informed by Mr. Brundage at Delano was entirely misleading. The fact is that it was on fruit shipped in from southern points. It was condemned and returned which gave rise to the rumor that it infested the trees.

## Southern California

Fullerton growers have been shipping tomatoes, receiving forty dollars per ton.

R. P. Cundiff has been appointed horticultural commissioner of Riverside county.

The Calexico farmers union held a meeting last Saturday to discuss the cotton situation.

This year's crop of English walnuts for the entire state will amount to about 25,000,000 pounds.

It is estimated that California will receive for the coming year's crop of oranges about $26,000,000.

The Brawley News is urging the more extensive planting of orange trees in the Imperial Valley.

Seventy carloads of walnuts have already been shipped from Goleta Station in Santa Barbara county.

Escondido, San Diego county, is greatly elated over gold medal awarded her raisins at the A-Y-P Exposition.

A ninety acre table grape vineyard in Escondido yielded $30,000 profit to parties who leased it during the past year.

Riverside and San Diego county people are discussing matters pertaining to a genuine county fair to be held next fall.

The directors of the Lima Bean Growers Association are much pleased at the results of its co-operative marketing effort.

The big pre-cooling plant at Colton will be in operation about December 1st and will pre-cool fifteen cars of fruit every three hours.

It is claimed that one orange buyer in the Highland district, San Bernardino county, is offering $1.80 for navels delivered during the coming season.

The horticultural commissioner muddle of Orange county has been settled by the appointment of Roy K. Bishop as horticultural commissioner.

The county live stock inspector of Imperial county has declared a quarantine against certain sections of San Diego county on account of Texas fever tick.

A walnut grower near Fullerton has been investigating as to the cause of blight and thinks he has a partial remedy which is aiding him in securing larger crops.

The Cultivator recently referred to the bean warehouses of Ventura county groaning under the stores of beans, and we now note that a large warehouse of Saticoy has collapsed under its big load.

A special agent of the Department of Agriculture in charge of sugar beet investigations, reports that the quality of sugar produced in this state grades up with anything produced in the world.

The cantaloupe industry of the Imperial Valley will probably be much decreased during the coming year, but it is now thought that it will drop into the hands of experienced growers and that a permanent industry will be built up.

## The Coast

The supervisors are doing much good road work near Yuma, Arizona.

The Idaho Pure Seed Convention will be held at Caldwell, Idaho, January 13, 14.

Intensive farming methods will be conducted on a 6,000 acre tract near Merrill, Oregon.

All the horse arlstocracy of Arizona was at the territorial fair at Phoenix last week.

The creamery at Rosalia, Washington, is turning out about 10,000 pounds of butter daily.

One bean grower at Orofino, Idaho, produced over 200,000 pounds of Lady Washington beans this year.

The Northwest Apple Growers Association held a convention at the apple show at Spokane last week.

A milk condensing factory at Hillsboro, Oregon, has been compelled to close down because of shortage of milk.

Orange growers near Phoenix, Arizona, are holding meetings in an endeavor to perfect a horticultural society.

Wheat growers of Washington have been handicapped in disposing of their crop this year because of lack of cars to transport it.

The entire Northwest was visited by heavy rains during the first few days of this month, doing great damage to roads and railways.

A mass meeting of farmers and tax payers was recently held at Yuma to take action regarding increased assessment and heavy tax rate.

There is strife between the sugar cane growers and good roads people in Hawaii as to the right of the irrigators to construct flumes across highways.

Chief Engineer Davis of the Reclamation Service and an expert hydraulic mining engineer have recently been inspecting the Roosevelt Dam in Arizona.

The Oregon Horticultural Society will hold its annual session in Portland, December 5 to 9. A fine premium list is an inducement for an exhibit of fruits and nuts.

Wool growers in session at Pendleton, Oregon, declared that the policy of the government in its control of the ranges in forest reserves tends to destroy the wool industry.

A farmer at Pomeroy, Washington, hauls his crop of wheat and barley thirteen miles to town with a sixteen horse team, hauling 225 sacks of barley and 175 sacks of wheat to a load.

The sugar cane growers of the Hawaiian Islands are compelled to fight the cane bud moth which eats out the buds or "eyes" of the cane and this results in the cane decaying.

The Oregon Agricultural College at Corvallis, Oregon, has made a slight departure from the usual line of publications and has issued the "Business Side of Farming" with many most excellent suggestions and several pages showing manner of farm book keeping.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

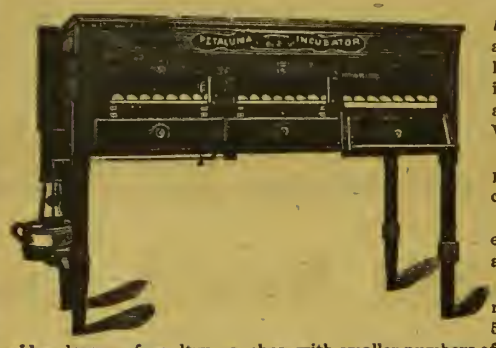
This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### CHICKEN POX.

SEVERAL California poultrymen report prevalence of chicken pox which with some has proved most difficult to control. We note a writer in The Standard holds to the idea that this trouble is conveyed to fowls by mosquitos. He says:

"It is supposed that the infection comes from the grain fed, or from the soil. My own experience, however, causes me to differ from this opinion. I find that chicken pox makes its periodical appearance at the commencement of the rainy season when mosquitoes are plentiful, and I have every reason to believe that these, if not the actual cause, most certainly propagate the infection. I have reared chickens during the dry season in the same brooders in which a few months before dozens of chicks had succumbed to the pox. They were fed the same grain that the afflicted birds had had, and while the lot bred during the rainy season had not been on the ground at all, on account of the excessive moisture and dampness which prevails at that time, those bred and reared without mishap in the dry season were allowed on the ground when two to three weeks old, precisely in the same runs that has been occupied by the stricken birds.

"However, mosquitoes are not necessary to propagate this disease, as we saw a chicken pox epidemic near here where there were no mosquitoes present. In this case, the weather suddenly turned cold, and the chickens that were afflicted stood with ruffled plumage and tails down, and appeared cold. They had a slight cough, but no running from the nostrils or eyes, nor was there an offensive odor. The disease affected them so quickly and severely, that the bright active cockerel of the previous day with blood-red comb and showy action, would appear a pale-headed, listless bird on the morrow. On the third day there would be one or more small, light-colored specks or warts on their combs or faces. The wart would not be larger than a pin head at first, but it would rapidly increase in size, and from being a lighter color than even the pale comb, it would quickly change—if not treated—to a dark brown color. At this time the wart would be an eighth to a quarter of an inch in diameter.

"Chicken pox commences and is usually confined to the face, lobes, wattles, nostrils and mouth, but it is occasionally found under the wings in advanced or neglected cases, due in all probability to the bird rubbing its head there in order to alleviate the painful irritation. There are two varieties of pox—the dry and the moist—the difference depends only upon the surface upon which the pox develops; that is to say, on the skin or on the mucous membranes. If it develops on the skin of the face, comb wattles or ear lobes, it will be the dry or warty variety. If it appears on the mucous membrane of the eyelids, nostrils or mouth, it will be the moist or the vesicular variety.

"The vesicular variety is much more serious than the 'warty,' and will rapidly decimate a yard. The reason is obvious. The pox on the moist mucous membrane grows rapidly, and is much larger than the warty pox. If it begins at the conjunction, it soon closes up the eyes, which swell to an enormous size, blinds your bird, and being unable to feed, it wastes and dies. If the bird is not treated promptly the eyeball may become involved, and of course, nothing can save the sight. If the pox appears on the nasal mucous membrane, the whole nasal cavity at once becomes blocked, and the bird breathes with open mouth and gasps for breath.

"Although the dry variety is not really dangerous, it is troublesome and a source of irritation to the afflicted birds. It consists of a small raised scab or crust of warty appearance about the size of a split pea, of a dark brown color, hard, dry and roughish surface, and seems to cling to the skin like a limpet to a rock. If the wart is pulled off, a small round, shallow ulcer is found on the skin. The scab is the cap of the ulcer and for treatment has to be removed. Microscopical examinations have shown that this ulcer contains a fungus with spores known as Aspergillus fumigarus, proved to be the cause of the pox."

"Chicken pox is exceedingly contagious, but when it appears in a flock there is no necessity for isolating the afflicted birds. Many of the remainder are affected and the symptoms will appear later. The best way to check the severity of the pox is to place a few crystals of permanganate of potash in the drinking water as a disinfectant—the water should be colored pink. It is well to wash the birds' faces and combs with a 50 per cent solution of creolin and water every night."

The birds that have the warts should be caught, and the crust of each wart removed. The underneath tissue is bright red in color. A clean feather is dipped in a bottle of pure creolin and the raw tissue of each wart touched with the liquid. The next morning the treated wart has a black scab over it, which dries up and falls off in two or three days. The underneath flesh has then grown normally, and a week afterwards, a person cannot detect where the wart has been. In treating the moist variety, drop pure creolin by means of a feather, into the affected eye, or squirt it into the nortril with a fountain-pen syringe.

We are assured that creolin full strength will stamp out chicken pox in short order. All drug stores keep it.

### POULTRY QUERIES.

**Roup.**

Will you please tell me what is the best remedy for chicks that have froth in their eyes? Also how do they get to be in that condition?—A Subscriber.

Frothy eyes and running discharge from nostrils is usually designated roup, but all colds have these same symptoms, and all colds are not roup. Roup proper has a very foul, offensive smell called the "roup smell" once known, never likely to be forgotten. True roup is very contagious, and mild cases may cause serious epidemics.

The causes are many; bad surroundings, in which is included foul coops and yards, soil upon which fowls have run for a long time being one predisposing cause, hereditary tendencies and weak constitutions caused partly by improper and insufficient food, sometimes by too much or too rich, food, and neglected colds.

If roup is not checked it becomes chronic, (if the bird survives), and a hen may afterwards fatten up and lay eggs, but those eggs will not produce strong and healthy chicks.

The treatment should be to remove every affected bird. If very bad use the hatchet and burn the carcass, for people sometimes take this disease in a mild form, but a very disagreeable one. The eyes are most often affected, and become very sore and "bunged up," so one better not run unnecessary risks.

After taking out the affected birds, thoroughly clean up the premises about the chickens, and spray the house and yards with a good disinfectant, say a 2 per cent solution of creolium, formaldehyde, creolin, sulpho-napthol or nap-creol, using plenty, and after the birds have gone to roost spray the houses about the birds, and

especially their heads, with a fine mist sprayer, the following solution: One teaspoonful of pure creolin to a gallon of water; breathing this vapor is very effective. But it doesn't pay to waste $2.00 worth of medicine on a $1.00 bird, which is my sentiment exactly. For simple colds a little aconite in the drinking water is said to be as good for chickens as for people 1-100 of a grain in a pint of drinking water, but that seems pretty much of a homeopathic dose to me.

The permanganate of potassium so often recommended in these columns (a 2 per cent solution, holding the birds head under until it strangles, which forces it through the throat and windpipe,) is a standard remedy with me, and will cure advanced cases of roup, but as I said before, of what use are these cured birds, anyway? For chicks with just a simple cold, an easily applied remedy would be to spray a very fine mist like spray after they go to roost, of camphor and water, using a teaspoonful of camphor spirits to a pint of water, allowing the birds to breathe the fumes. This will break up influenza very quickly.—Mrs. Frank Metcalf.

### A CHICKEN'S COMB.

HAVE you ever stopped to think about the comb of a chicken?

If you are a breeder of thoroughbred poultry, of course, you have bred to a certain type of comb and have discarded all birds that did not meet those requirements. The comb, like the human ear lobe, is of all sizes and shapes.

We have, in the numerous breeds, endless graduations, from those fowls nearly combless to those having immense fleshy growths.

Of the many types, the principal are, the pea comb, rose comb, single comb, leaf comb, V-shaped comb, spikes and in some, portions or all of the comb displaced by growths of feathers or crests. The comb gives a regal appearance to some birds and lends a finish and beauty to the head. Climate, environment, nutrition, all have their effect on the growth of the comb. Birds or breeds originating in warm climates have the predisposition to larger growths of comb than those of more temperate latitudes.

The game fowls of today have not the comb developed to the extent that had their ancestors of several generations ago. The fighting instinct has been fostered and the comb was dubbed or cut off, being in the way. This practice, with heredity, has perpetuated that tendency to small combs. The same condition caused by crowding and disuse of the little toe of man is breeding that member of the human anatomy out of existence, say scientists.

A fowl's comb is well supplied with blood circulation and upon close examination will be found to contain minute glands, sebaceous in character. Thus, perhaps, they exert the function of regulating the temperature of the body to a great extent. Being moist they are very liable to frost bite.

The immense growth of comb of some fowls requires a great amount of nutrition to sustain its healthy condition and to repair waste. Thus, it is reasonable to presume that taking two fowls otherwise alike, but one with a large comb, the other with none; that the one with the comb would require more food to support that growth. Taking a flock of several thousand fowls the difference in the cost of maintenance might be considerable. Now, can the nutrition that formerly went into the comb be diverted to the producion of eggs or flesh?

If so, we will have an improved breed of fowls. Some writers tell us that the original fowl was a bird of five toes, as the Dorking.

Has the loss of that fifth toe improved the resulting breeds in any way?

The comb is an index to the health of the fowl to some fanciers.

It is also an index of both male and female upon arrival at puberty and undergoes a marked change.

I have an idea that if a breed of prolific layers, say the Leghorn, could be taken immediately after hatching, the minute, undeveloped comb cut away and the surface cauterized with silver nitrate or other caustic, that the comb could be obliterated by this treatment being continued several generations and supplemented by selective breeding. The question is, would the resulting fowl be an improvement over the present 200 egg layer?

Much might be said on this and kindred subjects. The 300 egg layer is not an impossibility, I believe, with the system of selection now in use.—American Poultry Advocate.

## DRAINAGE OF IRRIGATED LANDS IN SAN JOAQUIN VALLEY.

THE San Joaquin Valley occupies more than three-fifths of the great central valley of California. Extending from the Tehachapi Mountains on the south to Suisun Bay on the north, it includes in its great expanse of comparatively level land a large part of the irrigable area of the State. The floor of this valley, with its foothill and mountain watersheds, is nearly equal in extent to the State of Indiana. The run-off from this basin reaches the axis of the valley through a number of nearly parallel stream channels from the Sierras and thence it is conveyed by the San Joaquin River to Suisun Bay, from whence it flows through the Golden Gate to the ocean.

For years after the discovery of gold in California the valley remained virgin soil. Bunch grass carpeted the swamp area of the trough of the valley; wild oats grew on the higher land near the foothills; but the large expanse of rich land between these borders supported only a scant growth of grass and alfilaria during the rainy season. During the greater part of the year the valley was too dry, barren, and devoid of green vegetation to attract even the herds of wild horses and cattle from the slopes of the Sierras. In the course of time, however, as the valley became settled, the grain raisers took advantage of the winter rainfall to raise profitable crops of wheat.

Irrigation development in this part of California dates back to the early seventies, when the people of Fresno county began to use a part of the water of Kings River for the production of fruits and grapes. Prior to 1875 a number of small canals were built to supply water to lands near Bakersfield, and in that year the Calloway Canal, belonging to the Kern River Land and Canal Company, was built to convey 500 cubic feet per second to lands on the north side of Kern River. The Modesto and Turlock irrigation districts, although organized in 1887, used little water until 1902. The practice of irrigation has gradually extended from these centers until at the present time there is probably more than 1,000,000 acres irrigated. The volume of water required for this area exhausts the flow of the stream after the spring floods have subsided, and in all probability one-third of the entire run-off from 16,000 square miles of Sierra watershed is diverted for irrigation.

The diversion of so much water every spring and summer from the natural channels and the spreading of it on the porous soil has greatly changed the natural conditions with regard to the water table. As a direct result of heavy waterings when the works were new, the subsoil dry, and water both cheap and abundant, the water table has risen in places with astonishing rapidity, a rise of 20 feet in four years not being uncommon. It now fluctuates between 1 and 8 feet below the surface, while, before irrigation was practiced, well water was available only by digging or boring to considerable depth. If the surplus thus accumulated could readily be drawn off through either natural or artificial channels, and the ground water thus prevented from rising too high, such a filling of the subsoil with waste water would be beneficial in any district having an average annual rainfall of 9 inches, as is the case in this locality. The drainage of this district, however, is very poor; many of the deep creek channels and ravines that drain the foothill area of the Sierras widen as the slope of the land decreases and disappear entirely before the trough of the valley is reached. Only those streams, which have their origins far enough up in the mountains to provide continuous flows, have the level of their stream beds far enough below that of the surrounding country to admit of the land being drained naturally into them.

While irrigation has raised the ground-water level in the better drained portions, it has seldom brought it near enough to the roots of vines, fruit trees, and alfalfa to do much damage. It is where the drainage is poor that the ground water has risen and caused destruction to deep-rooted plants and trees. The presence of water too near the surface reduces the area which is available as a feeding ground for plants, dissolving the alkali, which exists more or less in all the soils of the arid region, keeping the soil moist continu-

ally by capillary attraction, thus inducing a more rapid rate of evaporation and drawing up the alkali through the soil to the surface.—Farm Bulletin 217, "Drainage of Irrigated land in the San Joaquin Valley."

### FAKE EUCALYPTUS CONCERNS.

The Los Angeles Florists' and Nurserymen's Association held a session in Los Angeles last week giving a good hot roast to the methods employed by some promoters, and urging reputable papers and all who wish well for California to take a strong position against this abuse. The Cultivator has before this spoken of the action of this organization in this matter, referring to the fact that a Los Angeles morning paper had quoted from the claims of a promoter the statement that if the city of Los Angeles would plant eucalypts along the right of way of its aqueduct from Owens River, within ten years the twenty-five million trees there planted could be cut at a profit of one hundred millions. This "would wipe out the entire cost of the aqueduct and put seventy-five millions into the city treasury besides." The same article carried the idea that Mr. Mulholland, engineer in charge of the water works development, had endorsed the movement. As most of the route of the aqueduct is through a section too cold for most eucalypts, and the claim was absurdly inflated, it may be seen that the papers have been flooded with a quantity of hot air by these promoters in order to give them a pull with people who have money to invest.

The Association has no desire to discourage legitimate planting of eucalypts. Many of its members are seedsmen largely engaged in the introduction and gathering of the seed. Their business increases as the seeds are sold, but they realize that the permanency of their industry depends upon its reasonable handling. The immense profits offered by some of the promoters can only result in bitter disappointment that would in a few years bring about a reaction injurious to all branches of the enterprise.

Some of the most conservative of the promoters were present and endeavored to stem the tide somwhat, or at least to put a reasonable construction on the action of those who were endeavoring to foster the best interests of this state. One of these speakers insisted that the best land in California might well be taken for eucalyptus culture. This idea was opposed by the more conservative who did not feel that desirable land which is subject to vineyard and general fruit culture should be given up to the eucalyptus, but in any case, the miscellaneous planting of varieties which are as yet untried in this state, often in large numbers by some of these companies, may prove a disappointment.

Adaptability of different varieties to different sections was discussed. Mr. Theodore Payne gave an extended description of varieties known to do well under desert conditions, much along the line of a paper furnished by him to the Cultivator some months ago. Mr. Payne also gave a talk along the line of more conservative and truthful claims as to the profitableness of the eucalypts, which will be given in full in a later Cultivator.

The Association did not wish to be considered as opposing the use of the aqueduct strip for forestry purposes so far as such a scheme is advisable. Still more, the members felt that the afforestation of Griffith Park, a park of several thousand acres belonging to the city of Los Angeles, was worthy of careful consideration. They maintained that this project should be in the hands of a competent forester, and that such wild statements as that made by one Mr. Webb should be discouraged and not given place in reputable papers.

Another paper showing the great advantage of forest cover for our hillsides and the adaptability of eucalyptus for that purpose was given by Mr. T. P. Lukens of Pasadena, which will later appear in our columns as willl extracts from the address of Mr. Morris at the same meeting.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Frost Bitten Sorghum.

Is frost bitten sorghum injurious to stock?—I. W. H., Modesto.

The bulletins and books nowhere say anything about the loss of food values in frosted feeds. There must be some loss, however, of succulency and that is valuable for the milk cows. The danger in the frosted foods is in the decay that sets in so quickly. As soon as the frost passes out the molds come on and putridness comes on to make the food poisonous. This is one of the troubles with cold storage chickens and turkeys, if not cooked at once they cause ptomaine poisoning and bring on sickness.—M. E. S.

### Oat Hay for Milk Flow.

Will oat hay reduce milk flow.—B., Pasadena.

While oat hay is an excellent feed for animals it cannot equal alfalfa hay for the dairy cow as a milk producer. I should give the cow half and half, making the alfalfa the larger half. It is probably the love of a change that makes the cow leave the alfalfa hay for the oat hay.—M. E. S.

### Grafting Walnuts.

I wish to set out fifteen acres of walnuts of grafted variety. Where can I obtain black walnut trees of the best kind of seedlings or two year old stock to be set out this spring, trees being planted in orchard and later grafted? Would it be better to plant nuts in orchard form and wait a year or so longer. I note in recent Cultivator that trees fifteen years old have borne 150 pounds. Where can I find scions of such stock?—B. H., Ventura.

It is practically impossible to get scions of blight resistant, heavy bearing stock at this time. Shrewd walnut growers have awakened to the advantage of the grafting over their orchards to such trees, and these trees have been marked and scions engaged for a long time ahead. Often such a tree is in the orchard of the grower who is grafting over the remainder of his trees. In such a case he keeps all of his own scions. Nurserymen are also picking up desirable bearing trees. On account of this situation a large walnut grower remarked in this office recently that unless he had access to a blight resistant strong bearing tree to secure his grafts from at once, or could get good grafted trees from a nurseryman whom he knows to use care as to pedigreed stock, he would plant in orchard form one or two year old native black walnuts, leaving them to grow for two or three years, meantime keeping his eyes open for the most desirable nut he could find in California, then secure scions and graft over his trees as they stand in orchard form. Of course this presumes cultivation of a large body of land for a long time before it is brought into profitable production, but with interculture crops may be grown which will pay for the care of the land. We presume the nurserymen advertising in the Cultivator can supply the roots of the native black nut.

However, more particularly as to the bearing of 150 pounds per tree it must be borne in mind that no orchard can be made to average such production. A thousand pounds per acre is good. But 150 pounds has been greatly exceeded only by isolated trees which were not restricted in growth.

### Inoculating Alfalfa Seed.

You recently stated in the Cultivator that a half barrel of soil from old alfalfa field should be mixed with seed before sowing. How much soil will a half barrel inoculate? Do you sow the soil with the seed —J. C. Modesto.

We mix half a barrel of soil with a little less than half a barrel of seed. The soil is moistened and the seed stirred into it. The soil should be moist enough only to cling to the dry seed. This soil must be freshly taken up and mixed at once with the seed and sown at once, and covered at once. It will sow with the ordinary seed sowers or it will broadcast equally well. A little more soil will not matter but do not make it any less. The soil can be broadcast from a wagon over the land if the harrow is used to cover it at once. The soil must not be allowed to dry out nor be exposed to the light longer than can be helped as the bacteria are sensitive to sun and air.—M. E. S.

### Black Knot of Vines.

We have grape vines that have knots on them just above the ground. Is it black knot and what would you advise doing? Do grapes stop hens from laying? Where can we get Arabian alfalfa seed? —C. H., Turlock.

Many vines have black knot and we do not think it is a serious matter. We often have them knocked out while pruning and cover the spots with bluestone or Bordeaux mixture. When a vineyard is wintter sprayed with Bordeaux mixture these fungous troubles are rendered les hurtful. The cause of black knot is said to be the short pruning that causes the sap to burst out and then floating spores of fungi fall on the fresh spots of sap and root, there forming the characteristic black knot.

Small quantities of the Arabian alfalfa can be secured from the State Farm at Davis for experimental purposes. I do not know of any one having it for sale in commercial quantities as yet.

Fruit of all kinds fed in quantity stops hens laying with us. I presume it is because of the watery character and because they fail to get enough dry feed to secure a full diet.—M. E. S.

### Cow Peas.

My soil here in Tulare county is sandy and I wish to ask you what you think can be most successfully planted in young orchard for stock feed before plowing in the spring, and where may I get the seed? Where can I get Brabham cow peas mentioned in the Agricultural Year Book of 1908?—G. E., Dinuba.

Cow peas would not answer for

winter forage. They would not stand the cold of any part of California. While they are called "peas" it must be borne in mind that they are a bean and very sensitive to cold weather. Mrs. Sherman recently suggested that a mixture of barley or rye with a vetch makes excellent fodder. You may get the seed from any seedsman. Plant as for green manuring, instructions for which have been given in the Cultivator many times. The Department reports in the Year Book that Brabham peas were produced by a grower in South Carolina and that a few pounds of the seed were distributed in various sections of the south. Apparently none has yet come to California. An application to the Department at Washington might secure enough for a test, but this test should not be made until warm weather next spring.

**Milch Goats.**

What does a good milch goat cost? About how much milk will it give per day, and is there much cream on the milk?—G. B., Nordhoff.

Milch goats may be had at from $2 to $150, but for the ordinary grade goat $5 or $10 should buy a fairly good animal. A good imported breeder, however, comes high. We have seen goats of no particular breed which gave when fresh two quarts per day, but this only for a short time, dropping within a few weeks to perhaps a quart and holding that for several months. The milk strains now being introduced will give for long periods from three to four quarts per day. The milk is different from cow's milk in that the cream does not rise so readily It is richer in nutrients than in fat.

## CROP REPORTS.

The Crop Reporting Board reports: The preliminary estimate* of the average yield per acre of corn is 25.4 bushels, against 26.2 bushels as finally estimated in 1908, 25.9 in 1907, and 25.8 the average of the past ten years. The indicated total production is 2,767,316,000 bushels, against 2,668,651,000 as finally estimated in 1908. The quality is 84.2 per cent., against 86.9 last year.

About 3.0 per cent (79,779,000 bushels) of the corn crop of 1908 is estimated to have been in farmers' hands on November 1, against 2.7 per cent (71,124,000 bushels) of the 1907 crop in farmers' hands on November 1, 1908, and 4.1 per cent, the average of similar estimates for the past ten years.

The average weight per measured bushel of this year's wheat crop is 58.0 pounds, against 58.3 pounds in 1908, and 57.4 pounds, the ten-year average.

The average weight per measured bushel of this year's oat crop is 32 7 pounds, against 29.8 pounds in 1908, and 30.9 pounds, the ten-year average.

The preliminary estimate of the average yield per acre of potatoes is 106.5 bushels, against 85.7 bushels as finally estimated in 1908, 95.4 in 1907, and 89.6 the ten-year average. A total production of 367,473,000 bushels is thus indicated, against 278,985,000 in 1908. The quality is 88.9 per cent, against 87.6 last year, and 87.9 the ten-year average.

The average production of apples this year is 42.5 per cent of a full crop, against 43.4 per cent in 1908, and a ten-year average of 50.9 per cent.

### HORTICULTURAL PRINTING.

THE KRUCKEBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

### FERTILIZERS.

SULPHATE OF POTASH
$60.00 per ton.

For a short time we will sell Sulphate of Potash at $60.00 per ton.

This is the right time to apply it for maturing the crop and the new growth of wood.

This price won't last. Get your supply now from the Armour agent in your district.

THE ARMOUR FERTILIZER WORKS, Los Angeles and Colton.

### WANTED.

WANTED—5 OR 6 H. P. PUMPING plant including deep well pump for a 10-acre farm. I like to get answers from farmers. H. MADLENER, 1571 East 22nd St., Los Angeles, Cal.

WANTED—HARDSHELL ALMONDS for seed purposes. Address, FANCHER CREEK NURSERIES, Fresno, Cal.

### SITUATIONS WANTED.

WANTED—SUPERINTENDENCY OF orchard, by young man, married, fourteen years practical experience in Santa Clara valley. Understands cultivation, irrigation, spraying, drying, etc. E. C. MERRILL, Campbell, Cal.

WANTED—By one who has had several years experience as working foreman on citrus orchards a position in that capacity. An American, married, without children. Address RANCHER, care Cultivator.

### TREES WANTED.

FOR EXCHANGE—1000 PHOENIX Canariensis Palms, 1000 California Peppers, and 100 Black Acacias, 2 years old, in 4-inch pots. Want peaches, apricots, plums or apple trees, No. 1 stock. Address, H. L. BAUER & SONS, 737 S. Spring St., Los Angeles, Cal.

### HONEY.

SAGE HONEY, GUARANTEED ABSOlutely pure. One 5 gal. can, crated, f.o.b., $4.25, two 5 gal. cans, crated, f.o.b., $8.00. HENRY E. HORN. Riverside, Cal.

### RHUBARB.

CHOICE CRIMSON WINTER RHUbarb and Conover Asparagus one-year plants, from selected seed, for sale in large orders at a little over cost of digging expenses. Write for particulars. W. B. CURRIER, Sea Bright (Suburb of Santa Cruz,) Cal.

### HOGS.

BERKSHIRE PIGS—PERFECT TYPE, popular American strains. A few choice boars and sows. Herd Boar, Kingsclere Duke 111812. G. B. REEVES, Mountain View, Cal.

### DOGS.

COLLIE PUPPIES FASHIONABLY bred, a beautiful spayed bitch, two handsome males sable and white. G. B. REEVES, Mountain View, Cal.

### HOMES FOR CHILDREN.

HAVE YOU A BOY? IF NOT, LET us send you one. We want country homes for boys of all ages. Arrangements to suit. CHILDRENS' HOME SOCIETY, 2414 Griffith Ave., Los Angeles. Cal.

### RUBBER STAMPS.

SEND IN YOUR ORDERS FOR RUBber stamps, dies, stencils, etc. Catalogue on request. F. W. HOPKINS PTG., CO., 641 S. Main St., Los Angeles, Cal.

The sugar factory at Corcoran closed its season late in August this year with a total run of 12,000 tons of beets which gave an output of 26,000 bags of white sugar. The Visalia factory, which is owned by the same corporation, opened at the time of the closing of the Corcoran factory and closed October 21st. This factory sliced 9,280 tons which made 20,500 bags of sugar.

The bean yield of the San Joaquin Valley will not exceed that of last year, but prices are higher and growers will reap more net profit.

### MISCELLANEOUS.

THE ANCHOR EGG SEPARATOR works perfectly; no well regulated hotel or household can afford to be without it." So says Delmonico's Chef. Send ten cents or ten names of persons keeping poultry, and we will send one postpaid. Or for 25 names we will also send postpaid "THE POULTRY MANUAL" by those high authorities, F. L. Sewell and Ida R. Tilson, profusely illustrated. WEST COAST MILL CO., 705-709 So. Griffin Ave., Los Angeles, Cal.

A LABOR SAVER FOR WOMEN. Send 10 cents for three weeks trial. Electric Laundry Compound, washes clothes without rubbing. Saves time, labor, and clothes. No lime, lye or acids. Eight washings 25 cents. Money back if not satisfied. ELECTRIC COMPOUND CO., 823 S. Spring St., Los Angeles, Cal.

ONION SEED—THE AUSTRALIAN Brown is the onion for California, as it is the best keeper known. Our seed is the famous Maule Strain, 408 sacks grown this year from 1½ acres. We grow but one kind and guarantee them true to name. Price $1.50 per pound. Send orders to E. F. EDE, Kingsburg, Cal.

WANTED—AGENTS TO SELL "EASY Wash," the greatest invention out. Washes without rubbing. Does not injure clothes, contains no acid, lye or potash. Sample free. STAR MFG. CO., Lemoore, Cal.

FOR SALE—AN OPEN TOP SURREY at half price, cost $150, practically new. Call or address H. A. Perkins, 1732 Monterey Road, South Pasadena, Cal.

PRODUCER TO CONSUMER. RAISINS, loose Muscatels, (2 and 3 crown) in 50-lb boxes, 5 cents, F. O. B., Etiwanda, good quality, send for sample. A. H. DUGDALE, Etiwanda, Cal.

AN OLD ESTABLISHED NURSERY, deciduous and other trees; estimated saleable stock, $4000; orders now in; on account of other business must sell. J. H. WILLS. Real Estate, East Auburn, Cal.

### POULTRY.

FOR SALE—EGGS AND DAY-OLD chicks from R. I. Reds (Tompkin's Strain), S. C. and R. C. Black Minorcas (Northrup Strain), White Minorcas. Spring stock sold. C. U. CHAMBERLIN, Los Gatos, Cal.

FOR SALE—CHINESE PHEASANTS $5.00 a pair. Chinese Silkies, pullets $1.50, cockerels, $2.50. MRS. R. S. SPAULDING, 533 Walnut St., Woodland, Cal.

CORNISH FOWLS EXCLUSIVELY—The best for the table and for crossing. Beautiful and docile. Write for prices. Eggs $3.00 a setting. JOHN D. MERCER, 104 West First St., Los Angeles, Cal.

THE "20TH CENTURY COOP" IS THE best, moderate cost house, for practical, progressive or intensive poultrymen. Blue-prints, specifications, photograph of coop $1.00. MRS. A. J. BADGER, Oxnard, Cal.

PIT GAMES—SOUTHERN AND GRADE Japs. O. L. CRANE, Route 3, Santa Rosa, Cal.

### CATTLE.

SPECIAL — FOR SALE, HOLSTEIN bulls, two old enough for service and a number of yearlings. Also a few calves that are small enough to crate Julianas, De Kols and all the strains for which this herd has been famous are represented. The only cows to hold World Records raised in the state were bred on this ranch. Same blood still represented largely in the herd MINNEWAWA STOCK FARM, Fresno Cal.

REGISTERED JERSEYS — YOUNG bulls—Golden Lad strain, heavy milking dams. G. B. REEVES, Mountain View, Cal.

### BERRY PLANTS.

STRAWBERRY PLANTS—FINE ONES. Pedigreed thoroughbreds, grown and restricted by scientific propagation, enormously productive. Same price as common stock. 60c per 100, $3.00 per 1,000 crated. From sixty varieties I have selected three of the "very best," Jessie, Marshall and Dollar. J. A. POWELL, R. D. 1, Ripon, San Joaquin Co., Cal.

FOR SALE—STRAWBERRY PLANTS. A 1, Arizona, Jessie, Mammoth berry, Logan berry plants by hundred or thousand. F. L. WING, Box 342, Upland, Cal.

STRAWBERRY PLANTS FOR SALE—Vigorous and well rooted plants. Brandywine variety considered standard for coast. $2.50 per 1000. Address JOS. L. OSBORN, Gridley, Cal.

FOR SALE—50,000 CHOICE MAGOON strawberry plants, 500 Italian prune trees 2 years old, 2,000 American gladioli bulbs. F. FOLAND, Santa Cruz, Cal.

STRAWBERRY PLANTS FOR SALE. Magoon, $5 per 1,000; Brandywine, $2.50 per 1,000. Apply to F. E. TAYLOR, Soquel, Cal.

### FARM LANDS FOR SALE.

ALFALFA RANCH, 160 ACRES, NEAR Bakersfield, California. Here we offer you a rare chance to secure a highly improved home place. A good six-room house, large barn, bunkhouse, sheds and corrals. 60 acres good stand of alfalfa, balance farmed to grain crops. Water right includes one-third interest in good ditch and a complete pumping plant which is run by electric power, and develops enough water to irrigate the quarter section independent of the ditch. Good oiled road, ¼ mile from postoffice, church, school and blacksmith shop. All stock and implements necessary to run the ranch. $100 per acre; $6,500 cash, balance easy terms. KERN CITY REALTY COMPANY, L. S. Harman, Mgr., Kern, Cal.

FOR SALE—MY RANCH CONSISTING of 80 acres, 30 acres in fruit and 10 acres in alfalfa, rest pasture with good buildings and drier outfit, is located 5 miles southeast of Visalia with R. F. D., lots of water to irrigate flowing though the land; fruit mostly consists of French prunes and peaches. For further information inquire at SAM'L A. HUTH, Visalia, Tulare Co., Cal.

FOR SALE—PLACER COUNTY LANDS, Banner Fruit County, California. $5000 for 40 acres land, 14 acres in bearing orchard, principally choice varieties plums, good house, 7 rooms, bath, barn, school near; 2½ miles from Auburn. $4500—20 acres in famous Newcastle country; 1-3 deciduous fruit shipments, house and all necessary farm implements and stock. J. H. WILLS, East Auburn, Cal.

FOR SALE OR EXCHANGE—140-ACRE apple, berry, vegetable, and poultry ranch near Santa Cruz, Cal. WILLIAM RICHARD, 438 River St., Santa Cruz, Cal.

I MAKE A SPECIALTY OF ORANGE and alfalfa ranches and exchanges. 826 Main St., Room 9, Riverside, Cal. N. R. BELL.

## THE MISSION BELLS OF MONTEREY.

O bells that rang, O bells that sang
Above the martyr's wilderness,
Till from that reddened coast-line sprang
The Gospel seed to cheer and bless,
What are your garnered sheaves today?
O Mission bells; Eleison bells!
O Mission bells of Monterey!

O bells that crash, O bells that clash
Above the chimney-crowded plain,
On wall and tower your voices dash,
But never with the old refrain:
In mart and temple gone astray!
Ye dangle bells! Ye jangle bells!
Ye wrangle bells of Monterey!

O bells that die, so far, so nigh,
Come back once more across the sea;
Not with the zealot's furious cry,
Not with the creed's austerity;
Come with His love alone to stay,
O Mission bells; Eleison bells!
O Mission bells of Monterey!

—Bret Harte.

## WHEN HIRAM GOT MAD.

DID I ever tell you about the time Hiram got so mad? Well, in all the thirty-five years of our married life, and the fourteen years of our courtin' thrown in, I've never seen him so riled up. Why, he was so mad that he stood out by the woodpile, right in front of my pantry window where I could see and hear him, and said "Darn" three times. And they was the awfulest, most solemn darns you ever heard. Not one of your quick squeaky darns, but a deep drawn out 'way down in his throat.

I knew then that something would happen, and when next day Hiram had the rheumatism, I felt it was a just punishment sent direct from beaven, and I told him so as I rubbed his back and also rubbed in a good moral talking, too. It seems to affect him more, somehow, as if the moral lesson worked in the blood, and the harder I rubbed the better it was for him.

Every man has to have these talkings, and every woman has to find out the best time to give 'em. Some women wait 'til their husbands have bad a good dinner and are feeling kind of spoonylike and then tackle 'em, but I always take Hiram wben I'm a rubbing bis back.

But I set out to tell you of tbe time he got so mad. It was tbis way. It was planting season and Hiram had just finisbed a patch of peas. He had spent the day before in fixing up bis hen coops, and he told me that everything was so tight that he'd bet a cooky that that game hen couldn't get out. Old Speckle wanted to set and Hiram didn't want her to, so he let ber out, but land, old Speckle never did any harm anyway.

The one we call the game hen is a little, small boned tbing that caused Hiram no end of trouble. She would do more damage in ten minutes than an ordinary flock would in two hours. And you couldn't keep ber shut up. Some way or other she would get out. A visitor had told us he tbougbt she was a game hen, and it did look some like a game of tag to see sbe and Hiram a-chasing round the yard.

Hiram often said he'd kill her, but sbe wasn't worth eating, she was so small, and she laid a good egg, so he let her live. But several times he had gone so far as to say, "Dumb that dumb hen."

That reminds me of the first time I heard Hiram say anything like that. We had been keeping company for about three years and Hiram always walked home with me from singing school. Now my mother was very fond of cabbage, but wouldn't eat fried onions, but father just doted on friend onions, but didn't care a pin about cabbage, so motber compromised by frying a mess of onions the same day as she had cabbage, and Thursday was the day she had tbat dinner. It also was the night of singing school, and Hiram and I always went.

Well, one night Hiram wasn't there, so after class I walked home with the others. Pretty soon someone came along and said, "That you, Mirandy?" and there was Hiram.

I wonder how he knew me, for it was so dark that you couldn't tell a feather bed from a darning needle, so I asked him kind of soft like, 'cause I thought it was love that told him, and he said, "Oh, I thought it was you, 'cause I smelt the cabbage and onions." Well, I was mad, and we had some words. Hiram used language that I wouldn't repeat. No, not for the world would I repeat it.

But to continue. Hiram had just finished those peas and came into the house to wash up. Of a sudden, out he dashed and I was just in time to see him race round the barn after that game hen. And such a race as they had! Over the fields and through the orchard and back around the barn again. I saw that Hiram was mad. There was murder in his eye, so to speak. On his way he bad picked up an ax and I knew that the game hen would have to be extra spry to save her life this time.

When they came to the woodpile she seemed to stumble, and in an instant Hiram had her on the block and her head was on the ground. Poor old hen!. I felt sorry for her a-laying there in the dust when just before she had been a-scratching and a-picking Hiram's peas as happy as a ben could be. But such is life. Probably she never thought when she swallowed that last pea, or perhaps it was a fat, juicy worm, that it would be her last. Funny, ain't it?

And Hiram he felt sorry, too, now that the deed was done. I could tell by the look on his face, kind of long and solemn like, as if he was getting ready to make a prayer.

Just then, or perhaps a little after, we heard a joyful cackle, and goodness! if he hadn't gone and killed old Speckle. She had been calmly setting on a corncob under tbe woodpile and I suppose tried to get out of the way when she saw the game ben and there was that game hen up on tbe woodshed roof a-flapping her wings and saying triumphantly:

"Cut-cut-cut-ca-da-cut."

"Cut-cut-cut-don't you dare cut!"—Boston Post.

## CARE OF GLASS AND CHINA.

NO part of the home reflects the true spirit of the housekeeper more than the dining room, and there is nothing that proclaims good management more tban a dainty, neatly laid table, and the only requirements for an attractive table are clean linen and polisbed disbes. Before washing glass dishes, rinse out every particle of milk, fruit or anytbing that is colored, as hot water will sometimes drive the coloring matter into the glass and ruin its brightness. Nice dishes should never be scraped with a knife, as it will leave unsightly little scratches on tbem tbat can never be removed, and tbere is nothing better for cleaning tbem than bits of old soft cloth or soft tissue paper. Vinegar cruets and water bottles may be cleaned perfectly with crushed egg shells. Put them in the bottle with plenty of bot suds and let tbem remain over nigbt, then sbake the bottle vigorously and rinse out witb clear hot water. Cbina and glass may be kept shiningly clean by washing the pieces tbrough warm suds in which a little borax is dissolved. A little of the borax should be used in tbe rinsing water, and the washing, rinsing and drying should be done as quickly as possible. The finest dishes can be washed in this way witbout any injury to the painting or glaze, as the borax softens the water and gives a high polish to them. If the dish towels are boiled in the borax suds at least once a week they may be kept soft and wbite as long as tbey last.

Glassware can be mended witb melted alum and a good cement, for china is made of Plaster of Paris and

**F. Brownsberger, President**

Don't try to do too many things at once.

a thick solution of gum arabic. Common dishes can be mended with the gum which is found on cherry trees, but all mended dishes should be set away long enough for the cement to become thoroughly hardened before using. Dish washing is not such a disagreeable task when one is supplied with the right implements for expeditious and thorough work, and when everything is at hand you will find the labor is more than half done. —M. A. Y.

### THE YELLOW JACKET.

The yellow jacket is an inhabitant of North America. He lives in old rotten stumps and in the ground where it is most convenient to find him. He is a self-reliant little cuss, and about the best scrapper in the world for his size. He is better known to small boys than he is to men, who don't want to know him. No one knows where he came from or what he's here for. He was discovered many years ago, but history does not state by whom. He has been discovered many times since. The first time your Uncle Tobey discovered him he was half way up his pants leg. It was at a picnic, and that yellow jacket spoiled a good deal of fun. The yellow jacket wears black and yellow stripes around him. He also wears a stinger. The stinger is located on the south end when the jacket's head is turned north. It is his weapon of offense and defense. It is small, but is always in good working order. I have had some experience with both, and would rather undertake to shake hands with the hind foot of a mule than to "monkey" with the business end of a yellow jacket. If the yellow jacket has any mission on earth besides affording small boys an opportunity to be venturesome, he has never made it known to the public. A boy who has grown to be, say, 14 years old, and has never been stung with a yellow jacket, must be a very tame and gentle boy. Most boys are not satisfied until they do get stung. I have known gangs of boys to hunt yellow jackets' nests just for the fun of them— and being stung.

When a yellow jacket stings you the sensation is like running a red-hot needle into you about an inch and three-quarters deep. The only time yellow jackets are in good humor is when they are eating the juice of an apple or drinking cider. They are regular cider fiends. They will allow you to roll them around most any way when they are bumming you for all the cider they can drink, without stinging you. It is at a picnic or a campmeeting that the yellow jacket is in his fighting glory. Before deciding on a place to hold a picnic, the ground should be carefully searched and the picnic located as near the yellow jacket's nest as possible. It will enliven the proceedings and add to the excitement of the occasion. There'll be enough small boys around to keep things stirred up.—Ex.

### CONTRAST.

One sang of sorrow, one without a care;
And many said, with pitying eyes and dim,
"How deeply hast thou suffered, friend!" nor knew
It was their grief which found a voice in him.

Years passed, and all the anguish of his songs
Became his own, yet caroled he of bliss;
Men said, "How gay, how joyful, is thy soul!"
He made reply, "I sing of what I miss."

—Century Magazine.

"Since you got married you are late every morning," complained his employer.

"Well," explained the breathless clerk, "I have to button up the ashes and shake down a shirt waist and carry out the furnace every morning."

"Old Cush landed in this country in his bare feet ten years ago. Now he's got millions." "You don't say! Why, he's got a centipede skinned to death, hasn't he?"

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point?"

**MORE LIGHT**

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

**THE ANGLE LAMP**

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

| Lighht Amber | 10@12 |
| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb. | 25@29 |

### Hay.

Scott, Magner & Miller say:

Arrivals of hay for the past week have been 2806 tons, as against 2344 tons for the preceding week, an increase of practically 500 tons. We are not surprised at this, in fact we have been looking for receipts to increase considerably, and were it not for the shortage of cars which still exists at railroad points, we do not hesitate to state the the receipts would be much larger than they are.

We find that country demand, not only from San Francisco, but from the main hay sections from whom we have received reports in the last few days, is exceedingly light, and as several of our correspondents have informed us, not one-third of what they were shipping last season at this time.

The export demand to Hawaii, which is our principal shipping point, is less than it was last year at the same time. The feeding of cane-tops in the islands is becoming more general, which cuts down the hay demand very materially.

The alfalfa hay market is uninteresting, conditions being about the same as heretofore.

Straw is in light supply, as well as demand.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 18.50@19.50 |
| No. 1 wheat or wheat & oat | 16.50@17.50 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.00@17.50 |
| Other tame oats | 13.00@15.00 |
| New crop wild | 10.00@14.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.00 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.77½@1.80 |
| Barley No. 1 | 1.40@1.46¼ |
| Oats white | 1.57½@1.65 |

| Middlings | 36.00@37.50 |
| Mixed feed per ton | 28.00@33.00 |
| Shorts | 31.50@33.00 |

## Citrus Market

LOS ANGELES, Nov. 23, 1909.

Much difficulty has been experienced in the disposal of the earlier picked navels because of complaint of green fruit. While the fruit has been fairly sweet, the color has been against it and the trade has manifested a fear that it would be unsaleable. There have been no losses and as a rule it has commanded $1.85 to $2.00 f. o. b. California points. Excepting coloring and texture the general quality has been good.

Lemons are still going forward as rapidly as picked and cured and good prices are prevailing.

**SHIPMENTS.**

Total shipments of citrus fruits from Southern California points 307 cars, of which 151 were oranges and 156 lemons. To same date last year total was 270 cars of which 51 were oranges and 219 lemons.

Total shipments from Tulare county and northern districts 613 cars of oranges for the season.

---

NEW YORK, Nov. 19.—Two cars Valencias and two cars lemons sold. Market very steady on both oranges and lemons. Cold, cloudy, snowing.

### CUTTING PRICES.

With Apologies to "Hamlet"

To cut or not to cut. That is the question.
Whether it is not better in the end
To let the chap who knows not the worth
Have the business at cut-throat prices, or
To take up arms against his competition.
And by opposing cut for cut, end it.
To cut—and by cutting put the other cutter
Out of business—'tis a consummation
Devoutly to be wished. To cut—to slash—
Perchance myself to get it in the neck—
Aye—there's the rub; for when one starts to meet
The other fellow's prices, 'tis like as not
He's up against it good and hard.
To cut and to slash is not to end the confusion,
And the many evils the trade is pestered with
Nay, nay, Pauline; 'tis but the forerunner
Of debt and mortgage such a course portends.
'Tis well to get the price the goods are worth
And not be bluffed into selling them for what
So-and-so will sell his goods for.
Price cutting doth appear unseemly
And fit only for the man who knows not
What his goods are worth, and who, ere long,
By stress of making vain comparison
'Twixt bank account and liabilities.
Will make his exit from the business.

—Anon.

# Who Wants Baby Chicks?

We can supply 2500 chicks per week of the following kinds: Barred Rocks, Rhode Island Reds, White Rocks, Black Minorcas.

The price is $14 per 100, crated ready to ship.

White and Brown Leghorns are $12 per 100 ready to ship. 150-Chick Size Fireless Brooder only $4 if you order some chicks to come in it.

They are very light and chicks will ship safely anywhere in them. 50-Chick Size $2.50. Send for our chick and hatching egg catalog. It's Free.

## Business Notes

### OPPORTUNITY FOR DAIRYMEN.

An opportunity to secure an excellent string of dairy cows in full milk is offered by two separate auctions of first class dairy cows. These auctions are under the management of Messrs. Briggs & Weber, Auctioneers, 225-227 E. Sixth St., Los Angeles. The first auction is on Friday, December 3rd, at the corner of Slauson and Western Avenues on the Southwestern outskirts of Los Angeles. At this auction there will be 65 of the very best selected Jersey and Holstein cows, 35 heifers from the best of the cows, and also three Holstein bulls from 18 months to three years of age. These cows have been the property of V. Paggi.

The other auction is at the city of Downey on the old Kern Ranch. The stock in this case is the property of Messrs. C. R. Berry and M. E. Parshall. At this sale there will be 50 first-class dairy cows, one thoroughbred Jersey bull, three young work horses, and 40 tons good barley hay. Take the Santa Ana car and get off at Clearwater.

Messrs. Briggs and Weber have the reputation of handling dairy cows in such manner that will make this an opportunity for all dairymen. Of course, as usual they will provide a fine free lunch at noon time.

The West Coast Mill Company have found it necessary, because of increasing trade, to build another addition to their Poultry Feed Mill and Warehouse., Cor. Griffin & Alhambra Ave. This is the second time they have had to enlarge since they went into their new plant about 18 months ago. Their trade is growing rapidly, and as they say, good goods and right prices are telling the story.

A Colorado farmer relates the following in reference to the use of Hubbard squashes in that state: "A neighbor claims he can finish the fattening of hogs on Hubbard squashes in one-half the time he can with corn, while with pumpkins he can only make them hold their own. He says he can finish a hog in fair condition in six weeks on about one ton of squashes, making a 200-to-250 pound hog. He cuts the squashes and feeds them raw, and says the hogs clean up everyting, shell and all." The squash apparently has a fattening value greater than that of the pumpkin, and both pumpkins and squashes are worthy of more attention in swine husbandry than has been generally given them.—From Coburn's "Swine in America."

Do not keep the brood sow too closely confined. A reasonable amount of exercise is necessary in order to strengthen her muscles and give tone to her system.—Orff's Review.

The old sow that has been a good breeder and a good mother should be retained. Keep her as long as she can eat well.

The pig that is making the best gains has a certain kind of prosperity in his tail.

# An Extraordinary Work on Practical Farming

***Just Completed by L. H. BAILEY***
***Director of the College of Agriculture, Cornell University***

## A Complete Library of Outdoor Books in Four Volumes

This great work of Prof. Bailey's is most exceptional. We have hastened to make special arrangements with the Publishers whereby our customers may secure the complete work on unusually favorable terms, because we know that

**Everyone Interested in Growing Things Will Find It Profitable.**

No such work has ever before been published. No one man alone could possibly write so complete, authentic and practical a library on growing things; for, in addition to Prof. Bailey's own able writings, this work embraces the concentrated experiences of 300 specialists, each one of whom has been chosen as being the very highest living authority on his subject. This work is called the

**Cyclopedia of American Agriculture**

and is complete in four handsome, quarto volumes, so profusely and accurately illustrated that every part of the text is made clear enough for the veriest novice. It treats of the Planting and development of a farm, or orchard, irrigated fruit farm; up-to-date Nursery; General Truck Farm; Intensive Market Garden; Cut Flower Industry, Capital required for all, and hundreds of other important things too numerous to mention.

Besides these important matters, every subject vital to a Livestock farm or Dairy is thoroughly treated. Capital required to install a dairy, plans and directions for construction of most economical and most profitable buildings and machinery, with particular reference to sanitary Dairy stables.

**A Volume on Farm Livestock**

treats each animal separately and thoroughly. Cattle, horses, sheep, swine, poultry, and all domestic animals; how to select them, how to feed them and keep them in health, and how to breed successfully. Some of the best known experts in the country have made this volume the most practical treatise on farm stock ever published. A final volume deals in the most up-to-date manner with the sociological problems of farm life and the relation of agricultural interests to our national welfare.

# Deep Well Pumping Great Advantage to Irrigation

Written for the California Cultivator by Edward B. Kientz of Niles

THIS is a day of conservation and development, conservation of our natural resources, our forests to protect our rivers and valleys, development of our vast areas of arid and semi-arid country by better and improved methods of agriculture.

In that vast empire within our borders west of the Mississippi is the answer to the oft repeated question of the necessary greatly increased production to support our rapidly growing propulation. And how is this development to be brought about? By irrigation.

Irrigation is so closely related to development in the west that it has become synonymous with it. But while its value as a wealth producer in greatly increased yield has been conclusively demonstrated throughout this vast empire, the country itself is only partially developed as compared with the ultimate results to be attained through the judicious use of our water supply by irrigation. This condition should induce publicity as far as possible to any method of irrigation which has been found practical by thorough trials.

Hence the publication of this article which deals with one phase of the subject of irrigation and is written for the benefit of those interested in lands so situated that they can only be irrigated by deep well pumping or where this method for any reason is preferred to other systems.

A great deal of our land can and is being irrigated by the gravity system, but in all districts supplied by this system there are large areas of fertile land, that, owing to the contour of the land, cannot be irrigated with gravity water, but have an abundant supply of water below the surface within a practical depth or lift of deep well pumps.

Deep well pumping, as the term is generally used and accepted, means pumping from a source below the surface beyond suction limit. Until recent years, if water could not be secured within suction limit it was not considered a feasible proposition to attempt to pump water for irrigation purposes. But it had been shown what could be done by irrigation and this was an incentive for those owning land that could not be supplied by other systems to irrigate also. Their only alternative was deep well pumping. Hence a great need was felt for a pump that would deliver an irrigating head from below suction limit to or above the surface efficiently and make irrigation, under these conditions, practical and profitable. Such a pump, it was fully realized, would prove of unknown value in developing arid and semi arid lands.

The ordinary type of double deep well plunger pump was found to be impracticable for this work because each bucket completed its stroke at the instant the other commenced and both were on the dead center at the same time, causing a stoppage in the upward flow of the water and the necessity of starting the long water column from rest twice in each revolution of the pump, and that both clappers must close under the full pressure of the water column. The load on the buckets changing instantly from nothing to full load twice in each revolution caused a heavy shock or water hammer on the moving parts, and not only shortened the life of the pump, but a large part of the useful power was wasted in starting the water column from rest at the end of each stroke.

To overcome this obstacle in deep well pumping it was realized that it would be necessary to construct a double plunger pump that would produce a continuous stream of water from deep bored or dug wells efficiently. To meet this demand a type of pump was designed since known as the double plunger continuous flow deep well pump. This type of pump overcame all the foregoing objections by keeping the water column in constant motion upwards, without stopping at each stroke, thus permitting high piston speed and great capacity, a saving of the power lost in starting the water column from rest and eliminating the shocks on the moving parts.

With this perfection of suitable machinery by which deep well pumping for irrigation was made sucessful and extremely profitable, this system of irrigation has come to be preferred even where gravity water is available. The reasons for this are: a person owning his own irrigation plant is more independent, he can irrigate when he wants to and when he can do so to the best advantage; the water is pure and free and there is no danger of scattering the seeds of obnoxious weeds and plants, which are liable to ruin any crop; there is no loss from evaporation and seepage.

The first thing to consider in deep well pumping is an adequate water supply usually procured from bored wells. All over our western country there is a large supply of water below ground which only needs to be brought to the surface to transform the barren plains into gardens of productiveness.

The wells should be bored large for two reasons; first,—it gives more area for the water to get into the well. Second,—a larger cylinder can be used which will deliver a greater amount of water. The largest diameter of cylinder that can be used in a 10-inch well is 8-inch, using 9-inch O. D. Casing for column pipe and having a capacity of 300 gallons per minute. A 9-inch cylinder can be used in a 12-inch well using 10-inch O.D. casing for column pipe with a capacity of 400 gallons per minute, or a 11-inch cylinder using 12-inch O.D. casing for column pipe in a 14-inch well with a capacity of 600 gallons per minute.

The well should be cased and casing perforated at each water strata, either before or after the casing is put into the well. It is much the better plan to perforate the casing in the flat before it is rolled.

As will be noted from above, in all installations of deep well pumps, the pump column pipe in well connecting cylinder in well to powerhead at surface is of larger inside diameter than the cylinder. This allows the valves to be pulled for repair without taking the pump column out of the well, and the large pipe also reduces the friction to the minimum. The pumps deliver either at the surface or through long pipe lines at high heads above the surface, as desired.

The hydrostatic pressure of the water is 33 1-3 feet, that is water will rise to a height of 33 1-3 feet, in a perfect vacuum, at sea level, but in practice, with the most perfect of suction pumps, it is necessary to place the pump within 20 feet of the water level when pumping, in order to operate. This is impractical when the water level is at a great distance below the surface.

A complete deep well pump consists of the powerhead carrying the driving pulley, gearing and piston rods; the cylinder and valves; the inside and outside pump rods connecting the buckets with the powerhead at the surface, the guides on the outside rod, and the pump column connecting the cylinder with the pump head at surface; the check valve, discharge elbow, discharge pipe, air chamber, pipe line above surface and other fittings as needed.

The powerhead is placed on the surface of the ground and may be driven by steam or gasoline or electric motor, belt driven or direct connected. The driving pulley is furnished to suit the type and speed of the motive powers, using a friction clutch pulley when driven by engine or jack shaft, or a plain tight pulley when driven by electric motor.

The cylinder is placed at a point in the well where it is always submerged and requires no priming. In all cases the work is done in one lift from water level to point of discharge, no matter how deep the water level below the surface or how high the point of discharge.

It is very hard to give the exact cost of irrigation by pumping because of the varying conditions, and I do not know that I could do better than to explain what deep well pumping has done for California. I merely mention this state because I am more familiar with it than others. and what has been accomplished in California by this method can be repeated all over our western country.

There being an abundance of water, the use of deep well pumps has made gardens out of sections of California that for many years were looked upon as only good for grazing and for raising grain on a wet year. Land in these sections 8 to 10 years ago sold at $5 to $8 per acre; it is now selling at $150 to $200 per acre unimproved, brought about by the fact that they know by boring wells and installing deep well pumps their water supply is assured and their land valuable and productive.

If this had not been demonstrated by the use of deep well pumps, this land would still be worth only $5 to $8 per acre, as it would still be only grazing land. Orange orchards in California, 5 to 6 years old, that have been properly cared for, produce from $150 to as high as $500 per acre per year, and the grower in some few instances has received as high as $1000 per acre, but this of course is exceptional. It is not uncommon to net $300 per acre from a six year old orchard and it would not be looked upon as anything to attract particular attention. I merely mention these facts to show what irrigation, through deep well pumping, has done for one state in our great west.

In most districts in California where deep well pumps are employed, the water stands all the way from 50 to 300 feet from the surface, and in many installations of deep well pumps the cylinder is placed 300 feet below the surface and water has been pumped very successfully from these depths. Until recently water at this depth would not be considered as available for irrigation purposes, but it is thought nothing of at

**THE BUYING OF CITRUS TREES**
**IS A SIMPLE PROBLEM IN ECONOMICS**

You cannot extract sunbeams from cucumbers nor blood from stones, nor good crops of fine oranges and lemons from inferior trees. A poor tree is an expensive experiment entailing only vexation of spirit and a dwindling pocket book. Then why experiment with stock of doubtful quality? Why not get the best and be sure of the future? For 20 years we have been supplying the people who grow good citrus fruits with their trees in every citrus growing section of the world, and stand ready to serve you equally well. Why not write us and let us become better acquainted?

The economics of successful orange and lemon growing is tersely explained in our book, entitled "The Citrus Fruits; Historically, Horticulturally and Commercially," a copy of which is yours for the sum of 25 cents.

# Citrus and Sub-Tropical Fruits

## KEEPING QUALITIES OF LEMONS.

TO ANYONE who has carefully examined lemons as they come freshly cut from the orchard or as they hang on the tree it is clear that the fruit is oftentimes extremely variable in size, shape, and texture. It is quite generally held that lemons of a certain form are likely to prove good keepers, while those having other forms are liable to decay early. The unsymmetrical, usually undersized lemons grown in the bright sun are thought to be poor keepers, while those from the portions of the tree where the fruits are well enveloped by leaves and have a good size and symmetrical form are believed to have good "life." It has not been practicable thus far to experimentally test these suppositions, but it seems from what has been done that there is a considerable degree of variability in the keeping qualities of lemons from the same orchard and probably from different parts of the same tree.

### Relation To Structure.

Certain structural features, viz, those belonging to the rind, seem to be especially important in this connection. The rind, which consists of a layer of white, spongy packing tissue having a very variable thickness, is covered on the surface by the epidermis. This covering consists of a layer of cells so modified chemically as to be almost impervious to water. The degree of imperviousness is greatly increased by a dense outer cuticle of a very resistant material which is practically waterproof. There are a vast number of small pores (stomata) in the epidermis, through which gases enter and water, as vapor, escapes. These stomata open into small chambers in the outer part of the rind.

Additional characteristic structures, known as oil glands from the substance which is formed in them and which they retain until the skin dries up, are found embedded in the outer part of the rind at different distances from the epidermis. The oil in these glands is a volatile product, giving the characteristic lemon odor to the fruit.

The losses assigned to blue mold are in a very large measure due to the development of the fungus following injuries. It is probable that the true blue mold can not penetrate the uninjured epidermis of a healthy lemon, but when a break occurs it is able to enter and bring about the characteristic rot. The development of the defensive outer layers of the rind is a matter of great importance in view of the ease of producing slight, but fatal injuries to the fruit.

To test the strength of this defense, a simple puncture experiment was devised. It consisted essentially of an apparatus so constructed as to enable one to apply known and regulated pressure to a blunt point in such a way as to get the amount of pressure needed to force the point through the epidermis. The needle tip was found to puncture the epidermis and bring oil to the surface with more readiness when it was applied directly over an oil gland—that is, on the surface of one of the projecting papillae—than when applied in the sunken place between these. It appears that the nearer the oil glands are to the surface the greater the ease of rupture. In tree-ripe lemons it seems from the evidence thus far gathered that the outer-most glands are likely to be less protected than in the fruit which is picked green. This would seem to indicate that tree-ripe fruit might show a greater loss from mold due to injury than fruit picked while green.

In a similar study of tent-cured fruit, a resistance markedly greater than in tree-ripe lemons was shown. Indeed, the resistance to puncture in tent-cured fruit seems to be double that of tree-ripe lemons. This difference is probably due in part to other factors than the absolute strength of the walls of the epidermis, but the result represents practically the relative liability to damage dependent on the structure of the outer tissues of the lemon. It was found that the tissue beneath the tough outer epidermis was able to offer very little resistance when the point of a needle had passed through the epidermis.

Lemons are frequently subjected to steady pressure of various degrees of intensity, and are preserved from injury by the general strength of their tissues throughout. Under these circumstances, the white pulpy packing tissue between the epidermis and the segments plays an important part. The thickness of this tissue varies very widely. In the so-called "sinkers," which form a case of an extreme reduction, this tissue forms a very inefficient protection against injury. Hence, "sinkers" might be expected to be poor shippers.

### Texture.

The relation of coarseness of texture to losses is not very clearly marked. In general, coarse lemons have a strong development of rind tissue. But many smooth lemons are equally well protected. The thickness of the epidermis and the consequent ability of the lemon to withstand wear is well tested in the box during shipment, when, as frequently happens, the jar of the car in stopping and starting is transmitted to the fruit in the box. The result follows that the fruit is "rasped" on rough surfaces of the shook, particularly of the ends and middle crosspieces when they are not planed.

### Method of Curing.

The keeping qualities of different types of lemons also depend largely on the method of treatment to which they are subjected to bring them into marketable condition. Although the inherent condition of the fruit, due partly to its early history, will determine its ability to resist decay to some extent, there is reason to believe that the method of curing is an important factor in determining the life of the lemon on the market. The lemon growers as a rule agree that the so-called sweating process of curing fruit has a deteriorating effect, although no definite tests have been made which would fully substantiate this belief. The sweating process is resorted to only when the briskness of the market necessitates

a rapid coloring of the fruit. The grower, although he realizes the possibility of endangering the quality of his fruit, has at present no other method of curing lemons rapidly, and is therefore compelled to make the most of the process.—From Circular 26, U. S. Dept. Agr.

## A NEW AND PROMISING MANGO.

A few years ago Prof. P. H. Rolfs grafted a shoot of the Cambodiana mango on a bearing mango tree in his grove near Miami. This June it has produced a number of fruits, it being the first occasion on which this excellent variety has fruited in the United States or presumably in the new world. When this variety was first sent to the United States department of agriculture from Cochin, China, in 1902, Mr. Fairchild, who forwarded over a hundred seeds, said, "This is a delicious mango of medium size, yellow when ripe, with a faint but agreeable aroma. The flesh varies slightly from light to deep orange in color. It has an excellent, fine delicate flavor and is never stringy. It is not as rich as the Alphonse, either in aroma or flavor, but is nevertheless worthy to rank among the best mangoes I have ever eaten. Dr. Haffner of the botanical gardens of Saigon, informs me that this sort is never grafted, but is a variety which reproduces itself from seed. I believe there is a slight variation among the seedlings, although it is a surprisingly constant variety." Through the kindness of Prof. Rolfs, the writer has been enabled to examine and sample this mango. The fruit weighs about half a pound. The thin, tough, light yellow skin peels off readily and the pulp is quite fibreless and easy to eat with a spoon. Though I certainly prefer the Mulgoba flavor, yet this is an excellent mango with a spicy taste and not acid. Like several other mangoes which come prettly true from seed, it has several embryos in each kernel. On the whole, it is a most promising mango for those who do not desire to grow only the very best mangoes, but rather good, marketable onces, and who prefer the cheaper method of planting seeds to the more expensive methods of budding and grafting. The Cambodiana, if it proves as heavy a bearer, would be a more profitable mango to grow than the well known No. 11. It ripens early, about the same time as No. 11, which it is perhaps destined to replace. Seeds of this variety were again imported by the United States department of agriculture from Saigon, Cochin China, in 1904.—Jacksonville Times.

## CARE IN PICKING.

Manager Pritchard of the Placentia, Orange county, Orange Growers Association, issues a circular to members from which we quote.

"Before beginning another shipping season I wish to urge every one to unite with us in demanding better service from the help in the careful handling of fruit from the tree to the car. It has been proven without doubt that most of the decay comes from clipper cuts and stem punctures and bruises, all of which can be avoided if every grower will do his best. The board of directors has decided it is very necessary for us to have a picking gang. A good man will be put in charge with the power to hire and discharge, and no excuse will be accepted for keeping inferior help. The directors also decided that springs should be used on the wagons, and you are hereby notified that no fruit will be received unless handled on wagons having springs. I would suggest that every grower would procure a canvas cover for his wagon, to be used in hot dusty times as well as in damp weather. Care must be taken in picking fruit during cold weather, when it is damp from rain, dew or fog, all of which causes brown spots and often decay."

## FRUIT TREES EXHAUST SOIL.

"In considering the reasons why apple and other fruit trees do not bear as many or as fine apples as they did in the early days," writes Professor H. Carman, of the Kentucky experiment station, "I have been impressed with the importance of supplying the trees with fertilizers as the soil becomes exhausted and am satisfied that the greater relative difficulty experienced nowadays in keeping fruit trees in good condition is in part due to an exhaustion of the soil."

Trees forage more widely than smaller plants and may not show the effects of starvation as suddenly or as soon, but they must show it in time if grown long on the same land without anything being returned to the soil to replace materials removed by the trees.

He says that twenty crops of apples of fifteen bushels per tree, and thirty-five trees to the acre, equal 1,337 pounds of nitrogen, 310 pounds of phosphoric acid and 1,805 pounds of potash. Twenty crops of wheat of fifteen bushels per acre equal 660 pounds of nitrogen, 211 pounds of phosphoric acid and 324 pounds of potash.

Therefore, according to Professor Voorhees, twenty crops of apples remove more than twice as much nitrogen, half as much again phosphoric acid, and nearly three times as much potash as twenty crops of wheat. A good farmer would hardly think of growing twenty successive crops of wheat on the same land, no matter how good it might be, and it would seem to be still greater folly, according to the figures given, to attempt to grow twenty successive crops of apples without returning anything to the soil.—Green's Fruit Grower.

## BY THE TRAIN LOAD.

That the orange season is really here was shown by the string of refrigerator cars which came in this morning indicating that the "Orange Special" was again in commission.

This train will arrive from the north each day at about 6 a. m. and will remain making up the train and doing necessary switching, leaving this city with what fruit is consigned from here, shortly after No. 7 leaves. It will make stops at Lisco, Zante, Lindsay and Exeter and will deliver the fruit to the main line trains at Goshen.

Trainmaster E. J. Hatch was on the train which made its initial trip here this morning making the last of the arrangements for having the special run in regularly.—Porterville Messenger.

A strawberry grower at Grand Forks, British Columbia, is producing berries four and a half inches in circumference.

## PROGRAM STATE CONVENTION.

THE following outline for the program of the State Fruit Growers' Convention which will be held in Watsonville, December 7-10 has been received from State Commissioner Jeffrey. On Tuesday the morning session will be given over to the usual call to order, invocation, address by chairman, responses, and appointment of committees. In the afternoon the convention will get down to the regular discussions and program: Southern Oregon Apple Growers by Wm. M. Holmes, Apples on Our Menu by Mrs. Josephine Rodgers, The Apple in Southern California by Frederick Maskew, and Must the Apple Go to the Mountain by Prof. E. J. Wickson. The afternoon session will be given to discussions of topics of interest to horticultural commissioners. It will be conducted by Mr. C. H. Rodgers, president of the Pajaro Valley Apple Growers' Association. J. W. Jeffrey, State Commissioner, will give an address on the new horticultural law, and O. E. Bremner will give an address on Examinations and Requirements of the New Law.

Wednesday morning's session begins with The Almond Commercially Considered by J. P. Dargitz, Citrus Culture in the North by Prof. Elmore A. Chase, The Berry Industry by W. I. Newcomb, Latest Developments in Fig Culture by Prof. W. T. Swingle and G. P. Rixford. Afternoon Session: San Joaquin County Grape Growers' Asociation by Geo. W. Ashley, Report of the California Fruit Distributors, F. B. McKevitt, A. Growers' Marketing Agency by W. C. Walker, Report of Fruit Growers' Committee on Fruit Rates, R. D. Stephens. The evening session will be given up to a reception of delegates to the convention by the people of Watsonville.

Thursday forenoon session: Insect Pests and Diseases of the Apple by W. H. Volck, Fighting Frost by Prof. Alex. McAdie, Sulphuring Fruits by A. R. Briggs, After Fruit Production What? by John P. Irish. Afternoon session will be given over to a field day and excursion through the Pajaro Valley. At the evening session there will be two addresses, one on Insect Pests as They Relate to Rural Hygiene by Prof. W. B. Herms, and Planting Good Health on the Farm by Dr. W. T. Snow.

On Friday the fourth day of the convention there will be only two sessions, forenoon and afternoon. Forenoon session: Pre-cooling of Fruits by Geo. D. Kellogg, Crop Transportation and Storage by Prof. A. V. Stubenrauch, Horticultural Work at the University Farm by Prof. Warren T. Clarke. Afternoon session: State Road Problems by Nathaniel Ellery, Eucalyptus Commercially Considered by G. B. Lull, Report of Committee on Resolutions, Next Meeting Place, and Unfinished Business.

Those desiring rooms are requested to write to E. A. Hall, Watsonville, Chairman of Room Committee. A. N. Judd is Chairman of the Reception Committee. Railroads give fare and a third rates.

---

The third carload of cotton has been shipped from El Centro. A half cent increase in price is noted.

## SOILS AFFECT QUALITY.

We are coming more and more to realize the apparent fact that the quality of soil has a great influence on the kind of fruit produced on it. As yet the evidence accumulated along this line is of a non-experimental character. There is, however, so much of it that we cannot ignore it. When this mass of crude information is reduced to order we may be able to establish some very important rules as to the manner in which certain soil elements affect quality of fruits. It is certain that the kind of soil regulates to some extent the quality of grains; but the results are not so striking as in the case of fruits, in which quality comprises flavor, texture and the like.

In growing any one variety of apples in different parts of the country, this effect of the soil is very noticeable. At a fair held in St. Louis some years ago, a man known to the writer was discussing with an exhibitor the quality of a certain variety of apple. He mentioned the fact that the apples grown on the shore of the Atlantic had a fine flavor, but that the same variety grown on Western prairies lacked flavor. The exhibitor replied that it was not necessary to go to the shores of the Atlantic to get the highly-flavored fruit, but that the same kind of flavor was given by the soil of the Ozarks. He thereupon produced several specimens of this variety grown in the Ozarks and asked the visitor to test the quality. The latter found it as the exhibitor had declared it to be—equal in flavor to that grown in the East.

The geological surveys now being made of the different states are sure to ultimately shed much light on this question. People will in time comes to demand fruit produced in certain soils or on certain geological areas. It is possible that we will learn so much about the matter that the orchardist will be able to bring onto his land the elements of soil that will advantageously affect the flavor. Such knowledge will be a boon to the public, for it might be the means of eliminating from the market the fruit that is now such a disappointment to the buyers.—Farmer and Stock Grower.

---

## TESTS OF SPRAYING FOR CODLING MOTH.

Was your first spraying for the codling moth done just right? If so, it was almost impossible for you to find a worm hole in the blossom end (the calyx) of your apples at picking time. If calyx worms were common, your first spraying, for some reason was largely a failure. Perhaps the poison was of poor quality, and you may have used it in too small amount; but it is far more likely that the spraying was not thoroughly and properly done. Perhaps the application was made too early, before the blossoms were mostly off, or too late, after the calyx cups had closed; but it is more likely that you were in too great a hurry, used too little material, and sprayed from the ground, and so failed to fill all the calyx cups.

The one test of good work at the

first spraying is frequently to examine the blossoms to make sure that all have been filled with the spray.

To fill the calyx cups the spray nozzle must be elevated above the trees for the upper blossoms, which necessitates the use of a long spray rod and an elevated platform upon which to stand, unless the trees are very low.

The Colorado Agricultural College has usually recommended a medium coarse spray, but is now inclined to favor as fine a spray as can be thrown with sufficient force to make it carry well in to the outer calyx cup. A coarse spray requires more material and increases the likelihood of accumulating a harmful amount of arsenic in the soil.

The writer does not think that all sprayings, after the calyx cups have tightly closed, are useless; but after another year of experimentation and observation upon this insect, I am more strongly than ever of the opinion that a thorough spraying just after the blossoms have fallen will do more than all subsequent sprayings to prevent wormy apples; and if the first spraying for any reason is a failure, later applications will not prevent a wormy crop of fruit.—C. P. Gillette, Colorado Agricultural College.

### UNITE AND KILL THEM.

In order to be successful, a campaign of squirrel poisoning, or extermination by other means, should be general, for one farm may soon be restocked with the pests through the neglect of owners of adjoining lands to join in the war on squirrels. Hence the need of official action.

But intelligent self-interest should prompt every land-owner to fight the squirrel nuisance. There are numerous ranches in Contra Costa on which plague-infected ground squirrels have been found, and of course lands harboring such dangerous vermin are greatly depreciated in value if not entirely unsaleable.—Sacramento Bee.

### EUROPEAN VINEYARDISTS CATCH MOTHS.

Consul William Bardel reports to the department of commerce and labor that various experiments have been made recently near the French city of Rheims for discovering the most effective methods of destroying the moths of the pyralid and the cochylis, which insects are so harmful to the vinyards. The plan is as follows:

The best results have been attained by electric light traps. The trap consists of a portable post holding a five-candle electric lamp with an enameled reflector, from which, attached to three thin metal chains about eight inches long, is suspended a round tin-plate dish of about 15 inches in diameter. The dish contains water with a top layer of petroleum.

During the first night the traps were placed in three rows running parallel at a distance of about 200 feet, the distance between each two lamps being about 75 feet. On the first clear evening late in July the lights were turned on about 8 o'clock and remained burning until an hour or so after midnight. Soon after the lights were burning the moths commenced to swarm toward them and were rapidly killed, either by the fumes of the coal oil or by the coal oil itself.

The same operation was resumed the next clear night, only the lamps of the two outside rows were placed about 25 feet closer to those of the center row, and this was repeated in each of five subsequent clear nights, so as to finally bring the three rows within about 50 feet of each other.

# The Shape of a Plow

from the share-point back a third of the way across the mould board determines whether it pulls heavy or light. Three-fourths of the friction comes on this part, and this part of a John Deere plow bottom is shaped to split the ground like a thin wedge splits a stick of wood—that's one reason why John Deere plows are easy on your horses and economical for you—why the John Deere is the lightest draft plow in the world—and why there are more of them in use than any other three makes combined. We sell the John Deere plows, and carry a large stock of farm machinery. We want your business.

# Small Fruits and Vegetables

### THIS MONTH.

HARDY vegetables such as beets, carrots, onions, spinach, cabbage, cauliflower, lettuce, parsley, salsify, turnips, radishes and peas may all be planted this month. Reset asparagus, rhubarb and strawberries. Tomatoes, peppers and egg plant may be planted in hot beds for early crops in the least frosty sections. Ground which will be wanted in the best of condition in January should be heavily fertilized and spaded or plowed this month. Thorough working is beneficial at this time of year, besides it helps to break up and destroy nests of insects which will attack plants in spring.

In Gods Temples.
Courtesy State Supt. of Public Schools

Berries and small fruits should be pruned. All of last year's growth which has not been removed should be taken out and burned, and where there have been any fungous troubles thorough spraying with Bordeaux mixture will be beneficial.

### SETTING STRAWBERRIES.

It is very important that the plants be carefully pruned before setting. The roots can be cut back with a pair of shears or a sharp knife, clipping off about one-third to one-half of their length. When the plants are heeled in before setting it is best to put off pruning until the time of transplanting. In trimming the tops all dead leaves, stems, and all large leaves should be removed. In pruning the plant be very careful to see that the roots do not become dry. It is a good practice to dip the plants in a bucket of water and wrap in paper, including about 25 plants to the bundle, then the workmen can handle them without fear of drying out.

The ground having been given its final harrowing, mark it off at the desired distance with either a marker made for that purpose, or if it is desired a wire or garden line can be used. Some growers say that the rows should run north and south, and never east and west. The reason is that in the latter case one side of the row will receive more sunshine than the other. The methods used in setting the plants are numerous. Some growers simply run a furrow, drop the plants so that they rest against the land side, cover with a hoe and tramp the soil down with the foot. The remainder of the furrow is filled during cultivation. Another practice is to open the ground with a spade, insert the plant, and press the soil with the foot firmly against the plant. Setting with a trowel or dibber is the most satisfactory and surest method of getting the plants in the ground properly. The plants should be set so that the crowns are just even with the surface of the ground. This can not be done successfully when the plant is dropped in a furrow and covered with a hoe, neither is the spade method a success. Where the dibber is used this can be done, also the roots can be spread out so that each will come in contact with the soil, thereby insuring a rapid growth from the first. See to it that the roots are not exposed after setting, or that there are no crowns covered. In the former case the plants may grow but will be worthless, in the latter they simply rot.—Bul. 105 Oregon Exp. Sta.

---

The man who thinks it a woman's work to keep the garden going was not built on the right lines. The garden should be considered as important as any other part of the farm and treated accordingly.

---

"One year's seeding makes seven year's weeding" is very true of the soil of a well fertilized garden.

# Eucalyptus

We have a very fine lot of these trees in variety, ready for immediate shipment.

## Orange and Lemon Trees

Our Citrus Trees are of the very best one and two year buds. We claim to have the finest trees on the market for the next season's planting, in any quantity. We are also large growers of

Dixon, Illinois.

The Garfield County Poultry Association will hold its annual show at Pomeroy, Washington, Dec. 15 to 18.

# The Ornamental Garden

## THIS MONTH.

IN SOME sections of California little planting of annual seeds can be done at this time, but as a rule, especially near the coast, annuals wished for spring or early summer blooming may be planted during the entire month. Deciduous trees and ornamental shrubs may be planted as soon as leaves show that they are perfectly dormant. This would be perhaps as well done in the latter part of the month but should not be deferred until buds begin to swell, for when that occurs, the roots have been forming for some time and best results will be lost. Roses may be planted later in the month, especially if they have been dried off so as to be perfectly dormant. The hardier sorts may be handled at once and without so much care. Cuttings from dormant vines are so easily rooted in this state that it is sinful for every yard not to have an abundance of the very choicest of cut flowers. Make the cuttings eight or ten inches long. If the soil is sandy, place one-half to three-fourths of the length in the ground. If heavy, a little sand placed at the base of the cutting makes rooting more sure.

It is possibly a little late for sweet peas, but those who did not plant earlier or wish continuation of bloom can plant this month successfully. Pansies may be reset, as well as stocks, phlox, mignonette, candytuft, alyssum, cosmos and shirley poppies. Dutch bulbs which have not been planted should be put in the ground at once. Gladiolus are always in order, and for continuation of bloom this is a good time for planting. Eucalypts which were put in seed boxes earlier should be transplanted to flats at once.

## A COUNTRY HOME.

Much has been said and written on the discomforts and inconveniences of country life, but the truth is, life is largely what you make it, whether in city or country, and nowadays a country home has the greater advantages. The trouble is, most of the farmers do not realize how well off they are, and how nearly ideal their homes and lives might be.

Free rural delivery of mail and the telephones have removed the greatest objection to farm life, viz: isolation.

All the luxuries of city life the country home may have, and expend a less amount of energy to procure them than the city dweller must do.

The average city man works from 8 A. M. to 5 P.M. and then mows his lawn and sprinkles it, and often has to do sundry chores besides.

At the end of the year, if he is square with the world, he counts himself lucky; if he has saved one hundred dollars, he feels that he has done well. The city man really puts in more hours of faithful work than any farmer does—he has to or he'd lose his job.

Whenever a farmer uses as much brains about his work as a man who manages his own business in the city, he becomes a king, in a world of his own, and may have more luxuries than the average city man, for the city man is limited, and the farmer king is not.

Table luxuries of all kinds may be had in the country at less expense than in the city, yet many farmers do without vegetables, fruit, butter and milk; their tables have no fine linens nor festive flower pieces, and the unvarying monotony of bacon and potatoes, is enough to discourage the strongest stomach and knock a righteous liver galley west.

If a man owns one acre of land, and does not live in a wholesome, civilized manner, he has only himself to blame, unless his wife may deserve just a little of it.

Man is limited only by his abilities! What you really want to do, you can do!

Brains and books are just as necessary to a successful farmer as they are to a first-class lawyer.

After the business side of farm life is settled, the dear cozy home life is still left, and this the city man cannot have, for his home is limited, as a rule, to four walls and a small lawn, while the country home includes the orchard with its wealth of fragrant blossoms, or fruit laden trees; the barn, with its hayloft and hens' nests; the horses, that whinny their greetings and touch you with their velvet noses; the cows, that coax for nubbins; the calves, and sheep, and pigs, the rabbits and doves, that say in a language of their own which you have come to fully understand "Howdy"—and then, when you stroll down the leafy lane, hand in hand with your sweetheart-wife, and the whole farm menagerie's atagging at your heels—not to mention old Bose and the tabby-cat—would you trade this for anything the city has to offer? I trow not.—Green's Fruit Grower.

## FRUIT AND GARDEN NOTES.

In setting out fruit trees and shrubs of all kinds, notice that the wire holding the label does not fit too tightly around the stem. As growth proceeds these wires often become so tight as to cut into the bark and wood and in time cause the death of the tree or shrub.

The old-fashioned plan of raising the flower or vegetable beds is fast going out of style. The raised bed must be tended by hand and it dries out too fast in dry weather. Make all beds level with the surface of the ground to save moisture and make the work of tending them easier.

Gladioli may be grown either from bulbs or bulblets. Bulbs will produce flower spikes the first season. Full grown gladioli bulbs produce many little bulblets each season which should be saved and planted for future stock.

For early blossoming, plant aster seed in flats or the hotbed early in March and transplant the young aster plants two or three times in pots, separate hotbeds, or cold frames before open planting in the garden. Repeated transplanting induces a strong root system, which insures sturdy and rapid growth at the advent of warm, growing weather. Asters as cut flowers must not be picked till the blossoms are fully out. The buds do not develop after the stems are cut.

Fix all leaky roofs and broken window lights.

**ALFALFA** Fresh crop seed absolutely pure and high germination. Ask for our prices on your wants. This seed is sure to advance in price very soon and early orders will save you money.

Plant **Yellow Danver** and **Australian Brown Onions** for early spring crops.

# Irrigation and Forestry

## UNDERGROUND IRRIGATION.

W. F. Sutherst, Ph.D., Bishop, Cal.

IT IS evident that some better means of applying water to the soil than is now practised must be devised, for from all sides one hears of losses from improper irrigation, so that in some districts farmers are trying dry farming and generally find it successful. The first consideration for cultivation is to obtain a water supply, then to study the best means of utilizing it.

Surface irrigation either on pasture or cultivated soil is both wasteful and injurious; wasteful in the first place since the region at the water inlet receives far more than its necessary amount of water. An examination of the ground in such

At the Forks of the Streams.

places at the end of an irrigating period would show that for a considerable depth and distance each side would be soaked in water, while at the extreme end of the ditches the water would scarcely have soaked to six inches. In the case of cultivated land, the flowing water forces together the soil particles at the surface leaving a hard crust when dry which hinders sprouting crops and nips the growing shoots when further developed. On pasture this latter effect is not noticed, as the grass stalks and leaves act as a protection. The laborious work in hoeing the surface after irrigating nearly equalizes the good effect of the water.

The surface of the soil, however, is the natural inlet for water, but rain and dew rarely cause the inconveniences of irrigation. In the first place it is distributed evenly over the surface and does not compress the soil as flowing water does. Surface irrigation is the best agent in soil aeration, as the water first of all fills up the air spaces in the soil and then on sinking down draws fresh air to the subsoil. Every growing part of a plant needs air, and as the growing parts of the roots are at the extreme ends and therefore far away from the surface, one sees the necessity of attending to this part of the plant's life.

The best imitation of rainfall would be to have a series of perforated pipes running over a crop, which is carried out to some extent in Florida, but the inconvenience of having any overhead system of pipes would compel any one to lay them on the ground. If a series of side pipes were attached to a main and these pipes perforated, an ideal irrigation system could be made, the flow of water being regulated so as to allow enough to flow and be absorbed without running along the ground. The only objection would be in plowing and cultivating the ground where the pipes would be in the way of implements. Sub-surface irrigation is assumed to do away with all the objections of surface irrigation, but the great drawback is the trouble of keeping the roots out of the pipe or channels used. In a dry country the roots are particularly on the search for water, and will penetrate to a considerable depth and into any water course in this search, otherwise this system is an ideal one. Soil aeration would be of course less satisfactory, as the bad air in the soil would not be driven out unless the water rose to the surface. But the even distribution of the water, which could be regulated by lessening the holes of the pipes near the water inlet, is the great advantage of this system. The roots, however, will tend to leave the soil and work their way into the subsoil, where of course less plant food is to be formed, and in the case of fruit trees this is decidedly to be avoided; it might be possible to apply some substance to the pipes which would destroy the rootlets when they come in contact and so keep them from entering and choking them up.

On alkali ground a combined system of irrigation and drainage could be carried out by this system, and so wash out the alkali; the land after surface flooding, would then have the water drawn off by the underground pipes, of course in the opposite direction to the water flow, and this would also aerate the soil.

* * *

We may add that sub-irrgation has been tried in nearly every concievable way for more than 30 years in this state and we know of no case where any one system has been maintained for any great length of time.

The sprinkling plan as practiced in some cases in Florida is good in theory, but in some sections of arid California the atmosphere will absorb much of the irrigation.—Ed.

## RESISTANT PILE TIMBER.

"What wood is most resistant to the attacks of marine borers?"

This is a question uppermost in the minds of all owners of harbor property. Timber experts in some parts of the country give more attention to the solution of the question than others in many cases, and just now it seems that the keenest search for the most resistant pile timber is going on in the extreme West.

The claim is made that eucalyptus piling is more resistant to the attack of marine borers than any other pile timber found on the Pacific Coast, also that certain eucalypts are more resistant than others. It is also claimed that Lawson cypress is particularly resistant to attack. Furthermore, some prominent engineers assert that many creosote treatments now practiced are not effective against borers and that various pile casings are of doubtful value. It is true that a great many piles, both treated and untreated and consisting of different species, have been driven, but in most cases records of durability have not been kept and in no cases have the different species and methods been directly compared under exactly the same conditions, thus making the results of little value.

With a view to furnishing this authoritative information the Forest Service has planned a series of experiments to be carried out at San Francisco and San Diego. It is the intention to secure several piles each of all of the species of timber occurring on the Pacific Coast which might be used for pile purposes. This will include different species of eucalyptus, Douglas fir, western yellow pine, western red cedar, redwood, and Lawson cypress (Port Orford cedar). In addition it is the intention to secure Dougas fir piles treated with various preservatives and protective coverings. In the experiments only 8-foot sections having an average diameter of 10 or 12 inches will be employed, inasmuch as the cost of handling and transporting larger piles would be prohibitive.

One-half of each kind of timber

will be installed at San Francisco and the other half at San Diego. The sections will be fastened to concrete caissons if available. If not, the sections will be fastened to creosoted piles. In such a case they will be so fastened that a space of a few inches will occur between the creosoted pile and the experimental timber. This will guard against any influence which the proximity of the creosoted pile might have on durability. They will be so placed that the upper end will stand about a foot or two above low water mark.

The ends will be properly protected with asphaltum, copper, or some other suitable substance to guard against the longitudinal attack of borers. Each section will be properly marked with a copper tag for identification. In addition a detailed map will be drawn showing the location of the sections after they are placed in position. In no case will less than six sections of one species be included. The experimental material will be inspected at frequent intervals and reports will be prepared covering the details of the experiments.

Some difficulty is being experienced in securing a sufficient amount of timber for the tests, especially the different species of eucalyptus. Any owners of eucalyptus timber who are willing to furnish a small amount for this purpose should communicate with the Forest Service, San Francisco. Already several manufacturers of pile casings have signified their desire to have piles treated by their various methods. It is hoped that all such treatments will be well represented.

## HOW FOREST FIRES START.

"These forest fires are more often started by some one throwing down a match carelessly or spilling out the live ashes from his pipe," says D. Whittaker. "When we were building the extension from Champion to L'Anse, years ago, some of the boys thought they would go down to Champion for a time. Coming back, one of them lit his pipe and threw the match into the dry grass.

"Before that fire burned itself out it had traversed a strip of territory sixty miles long and five or six miles wide. We lost hundreds of thousands of ties by the fire, to say nothing of the timber that was burned over—all because a man was not careful where he threw a lighted match. When such fires once get started they burn themselves out; you can't stop them.

"And they play some queer freaks. I have seen great pine trees, standing out alone in a space 100 yards or more from anything and suddenly the fire would jump out and a few minutes later nothing would be left of the tree but the trunk and scarred burnt limbs. I remember one case of the kind where a handsome, big pine stood out alone. Suddenly the flames seemed to gather themselves into a big ball and burst over the top of the tree like a shell, enveloping it in fire. It burned as though it had been kiln-dried.

"Somehow the fire seems to take all the sap out of the tree. That tree was completely destroyed in a short time, the fire sweeping on and leaving it a grotesque and blackened trunk, where before was a beautiful picture.

In the old days the Indians were very careful of fire. When they broke camp in the morning after going a short distance one of the band would go back to see that there was no spark unextinguished. If there was he would be sure to put it out. If he did not return to the waiting band soon, two or three others would go back, and if there was any fire they would help him extinguish it.

"In that way forest fires were prevented. Nowadays, with white campers and picnickers going into the woods and leaving without care whether they leave sparks which may cause a blaze or not, it is hard to preserve the forests. I presume it was something of that kind which started the fires in that country up in British Columbia. I know the country; it is densely timbered, and a fire there will mean the loss of hundreds of thousands of dollars in standing timber, to say nothing of the lives said to have been lost."—Milwaukee Sentinel.

## WATER IN ALASKA.

Contrary to popular ideas, the chief obstacle in the way of a large and increasing gold output from Alaska is the lack of water. Over the whole of Seward Peninsula, which produces a fourth of the gold of the Territory, and in most of the interior as well, the climate is comparatively arid, except in small mountain areas. The total yearly precipitation ranges from 10 to 25 or 30 inches, and as much of this comes in the form of snow, which melts and runs off in a few days in the spring, the discharge of the streams becomes very small in an ordinarily dry summer.

The operation of the gold placers in Seward Peninsula had by 1906 reached such a stage of development that their future success was largely dependent on the possibility of mining large bodies of relatively low-grade gravel. The most common method of working such ground has been by hydraulicking, for which a large and steady supply of water under a high head is a necessity. To obtain such a supply a large number of ditches were built, many of them long and constructed at great expense, without first making sure that they could obtain an adequate water supply. The results of such a policy were forcibly shown during the last three summers, particularly in 1908, when the severe droughts caused much loss.

For this reason the United States Geological Survey has engaged in the work of procuring data by which the miners may be able to estimate with reasonable accuracy just what water supply they can count upon. Hydraulic developments have been carried farthest in southern Seward Peninsula. Attention was first given to this region and the results of the work of 1906 and 1907 were published A supplementary report bringing the statistics up to date has just been issued by the Survey as a chapter in Bulletin 379. It can be had free of charge from the Director, United States Geological Survey, Washington, D. C. In addition to data obtained in the Nome, Grand Central, Kruzgamepa, and Kougarok basins, the field of work was widened to include the Solomon and Casadepaga drainage basins and the Fairhaven precinct. The report is by F. F. Henshaw, who conducted the field work, assisted by A. T. Barrows.

Farmers institutes were held at Arlington, Clayton and Tempe, Arizona, last week.

The giant sequoias of California are the oldest living things upon the globe. They come of a race which, according to the calculations of the geologists was well developed ten millions of years ago. The family was a large one once distributed throughout the northern hemisphere as far as southern Europe, but now only two species remain, the redwood, so abundant in the coast mountains, and a few isolated groups of the giant sequoia. In some of these groves the tree reproduces itself while in others it has ceased to reproduce. The most astonishing thing about these trees—far more imposing than their enormous size—is the great age of those living in California today. John Muir declares that one of these trees, the rings of which he has counted, was one thousand years old when Homer wrote the Iliad and two thousand years of age when Christ walked upon the earth. Thus these living trees are far older than our civilization.

Irrigation projects are under way in southern Nevada under the Carey Act, which will reclaim about 48,000 acres.

By the discovery of a large section where artesian water may be had in large quantities near Las Vegas, Nevada, the agricultural possibilities of southern Nevada have been greatly increased.

Drainage District No. 1 of Butte county has filed complaints against various people for collections.

# J. B. Wagner's Experimental Grounds

## Practical Work by Pasadena's Indefatigable Worker with Plants. Giant Rhubarb Showing Fine Results.

ONE OF THE pictures shown on this page gives something of an idea of a walnut tree growing on the experimental grounds of Mr. J. B. Wagner of Pasadena. This tree was planted seven years ago, being then about the size of a lead pencil, so small, in fact, that a workman passing it later with his cultivator, treated it like a weed and cultivated it out bodily. It was later replanted by Mr. Wagner, with the result that instead of growing one straight stem, three trunks came up, as shown in the picture. Not being given immediate attention, the three branches attained such size that Mr. Wagner determined to let them all stand, and they have made the enormous growth shown in the photograph. The three stems each approximate about one foot in diameter, the larger having a diameter of fourteen inches. English walnut seedlings planted at the same time and standing near this tree (one of which may be seen back of Mr. Wagner in the picture), having the same treatment, show trunks with a diameter of four to six inches and tops which make no comparison whatever. This tree is a hybrid of the English Softshell and the Eastern Black. The wood is not so dark as that of the Eastern Black but more of the shade of mahogany, with grain much finer and closer than that of the Eastern.

Hybrid Walnut with Great Future.

As a lumber proposition, we imagine walnut trees which will make such a rapid growth as that will crowd the eucalyptus trees very hard as a favorite. In illustration of this, a certain piece of furniture, an exceptionally fine library table, is priced in a Los Angeles furniture store at $150 in any oak finish, $200 in mahogany, and $250 in black walnut. If such is the case, it proves the wonderful value of walnut lumber.

This is simply mentioned as showing one of the lines of work engaged in by Mr. Wagner at his Pasadena experimental grounds. His principal work is the development of rhubarb on which he has labored so many years. Articles have been given heretofore describing this work and showing how indefatigably he has labored to develop a larger and better strain of this luscious "fruit." Formerly, he has grown and distributed largely the popular Crimson Winter variety introduced by Luther Burbank several years ago. These plants Mr. Wagner has distributed in many sections of the state and still has many thousands of plants to dispose of. But not content with this, he has introduced varieties from all parts of the country and the world, even going so far as to experiment with the common docks which are of the same family as rhubarb, thinking possibly some feature of it might be valuable in building up a strain of rhubarb such as he desired. His ambition was to combine all the desirable qualities of the Crimson Winter and the greater size of the giant rhubarbs.

As a result of these experiments, he has developed a wonderful stock as to size and length and all the highest qualities. In color it is hardly as red as the Crimson Winter, but the other more desirable qualities have been added to it to such an extent that it bids fair to prove a wonderful wealth bringer to this state. It looks so promising that Mr. Wagner has already been offered one hundred dollars per root for some of the full grown specimens of these plants, and three years ago was offered $50 each for the entire lot of plants he then had. This offer was by one of the leading seed firms of the East.

As yet he is holding entire control of them, excepting a few which he has granted to the state experiment stations and to the Department at Washington to test under other conditions than prevail at his grounds in Pasadena. In looking over the plants last year, one of the officials sent from the department of agriculture at Washington to inspect Mr. Wagner's work, stated he had never seen its equal—though he had seen rhubarb growing in almost every nation on earth—surely a compliment to Mr. Wagner and indicative of the worth of his experimental work.

These are all promising well and from them it is hoped large distributions may be made later. Mr. Wagner has about determined to make a distribution of a very few small plants this season at five dollars apiece. This plant is a hybrid of the Lorenzo or strawberry and the Crimson Winter.

Mr. Wagner's work is not entirely along the line of development of new species, but also in producing the most from the old and favored varieties. For instance he has his place divided into plats handled with different methods of fertilizing. Two rows which we show in photograph on this page give a slight idea of the difference in the two rows, a difference which is most marked in the field. The row on the left the second from the one by which Mr. Wagner stands was planted on good rich soil, as was the one by which he stands, both had the same care for the first year. During the last year the ground of the latter row has been treated at two irrigations with an application of urine saved from dairy stables, and applied while water was flowing in irrigation furrow. This treatment is comparatively inexpensive, and the wonderful difference in the production of the two rows and in their appearance, shows the worth of this waste of dairies which is most often allowed to run away and be lost instead of being saved by absorbents. Mr. Wagner thinks that by far the greatest worth of cow manure is lost in this way. His experiments have proved the advantage of using it on rhubarb, for we doubt not the tonnage from a row so handled would be twice that of the unfertilized row.

Other plats have been handled differently, one with fresh cow manure, one with decayed cow manure, one with fresh horse manure, one with commercial fertilizer, and one with grape pomace. Strange as it may seem, the most remarkable results have been secured from the use of grape pomace. The row fertilized with grape pomace is alongside of the one fertilized with fresh cow manure and shows a growth so much greater that a person passing along by the two rows would naturally remark as to what caused the difference in the two plats of rhubarb. Its application was made before the rhubarb was planted and thoroughly worked into the soil. Other experiments where the fresh pomace was applied to land immediately alongside of rhubarb already planted proved that the gases arising from the freshly distributed pomace were poisonous to the foliage, so that care should be used in distributing fresh or raw pomace anywhere near vegetable growth. Some rhubarb showed remarkable "burning" where this had been done. Orange trees, however, where branches came down to the ground showed no such results. Where old pomace was used this burning effect is not noticeable.

Wagner's Giant Rhubarb.
Note difference in thrift of the two rows.

Mr. Wagner maintains more strongly than ever that great wealth will yet be brought to California from the extensive planting of rhubarb. Its greatest output is in winter time, January to April giving exceptionally heavy growths. Refrigerator cars will place this in the Eastern markets at a time when they are comparatively bare of any other similar fruit. Car load shipments have already been made which have brought immense profits to growers.

Mr. Wagner will make an interesting proposition to any one interested in growing a profitable crop. Write him promptly before his supply of plants is reduced. His address is, J. B. Wagner, Pasadena, Cal.

# Bees and Their Care

## BEE CULTURE.

THE following is from an address made some months ago by Prof. Ralph Benton of the State University at various Southern California Institutes:

The first element of success to consider is the choice of the best honey producing plants. California has in abundance at least a dozen that are very valuable. Amongst the best are, Purple and Black Sage and Phacelia. Second best, Mustard, Spanish Bayonet, Manzanita and several of third quality and still lower grade.

Sweet clover furnishes an abundance of good honey where it is grown, the white being better than the yellow. Alfalfa and orange are excellent and eucalyptus furnishes freely and of fair quality but out of season for bee flight in cold localities.

Migratory bee keeping is being largely considered and in some cases successfully. The second consideration is choice of favorable location, both as to distance from easy market, and length of flight to and from their harvest fields to the hive, for the bees. Also the choice between level and hillside apiaries, shelter from hot sun and fierce winds, reasonable nearness to fresh running water.

In places where the noon sun will reach the hives, the shade of growing or freshy cut trees is beneficial. Morning sun is good, the early flow of honey is best and the bees rested and vigorous, and the secondary flow in the afternoon in mild sunlight is also good. Keep them quiet as possible from outside disturbance, especially on a hot day as it makes them nervous, cross and inclined to too much swarming, which weakens the colonies as well as interrupts their work. In apiaries of 100 or more hives or colonies the more hours of bee labor the more honey, and a little disturbance and confusion often means to the owner the loss of hundreds of pounds of honey. Avoid windy locations, also draughty places. Do not locate where bees will have to carry their load more than three miles if you can avoid it, and if your hives are lower than the honey fields so much better as the loaded bees can take a downward instead of rising flight, and there should always be lighting boards at each hive entrance so they can settle and rest for a moment, afterward crawling into the hive instead of flying direct into the opening.

A gentle slope with good drainage, good water as before suggested, but not so close as to endanger the property in case of floods, and we reach the arrangement of the hives. This must be governed somewhat by surroundings, but the storage or honey-house should be at lower level than hives and a very good way is to have the rows of hives radiate upward and outward from this bouse in such a way that they are easily approachable from the back of the hives,

They can be set in twos, a foot apart with safety and convenience, but do not crowd them. Have space enough to operate each colony without disturbing others. If your grounds can be terraced so the hives can be in tiers, each terrace a man's height above the next below, it is a most convenient plan for both man and bees.

If honey is to be extracted before the comb is capped, the distance above the ground is a mere matter of taste, but if you desire the best honey it can only be obtained by ripening sealed in the comb as the bees only can do the work; there must be stories added from time to time in which case the hive should be only a few inches from the ground to begin with. The ten-frame Langstroth hive is the best, and the empty stories can be always inserted next above the lowest, the filled ones lifted to admit them, as bees always enter the hive at the base, keep their brood combs surrounding the entrance and store honey in the rear and above the brood, and they do not like to still farther climb over filled combs to store the new honey. It is also detrimental to the condition of the comb to have them crawling over it.

One hundred hives is enough for one apiary, and in that number or even less there should be shrubbery, trees, etc., as landmarks or they get confused and sometimes enter the wrong hive which always makes trouble among them.

If necessary to feed the bees, feeding in small quantities makes them greedy, stimulates them and increases their numbers, but in large quantities they will quietly store their supplies and use as they need. It is always best to feed inside the hive to be sure the right swarm gets it.

## HIVING NEW SWARMS.

To prevent swarming requires different equipment, which is not necessary where one is in the bee business for the purpose of getting honey for home use, and to escape the buying of the different kinds of adulterated sweets that are offered on the market. Four or five swarms of bees will keep up the honey supply for the ordinary family and provide a delicious sweet, cheaper and better than that of the mill and market. Hive the largest swarms only, and for your own use merely, you need not winter more than a half dozen swarms. If you can get the price of lumber in hives, and the honey contained in them for wintering over, you had better sell the surplus and start some neighbor. It is more humane than to kill the bees and may be the means of putting the molasses jug or syrup keg out of commission.

If you have no bee catcher, locate the bees near brush, grove, or orchards, so as to be accessible. Spread sheet under the branch where the swarm hangs. Bend or cut branch down low, give a sharp shake or jerk and the bees will fall on the sheet. The hive should be tipped up a little without the bottom, and covered on the top. If the bees hesitate about going in, wash hive with clean salt brine, or put hive in another position. Dirty or ill-smelling hives are always rejected by bees for homes or lodging.—Farm Stock and Home.

# CALIFORNIA CULTIVATOR CLUBBING PRICE LIST

## Good Until October 1, 1910

Periodicals in any club offer may be ordered to the same or different addresses. Foreign and Canadian subscriptions require extra postage and rate must be obtained by correspondence. Subscriptions may be either "New" or "Renewals" but it is important that this information be given in each case.

All orders must include a year's subscription to the CULTIVATOR. Write plainly all names and addresses to avoid error, and send all orders to the Cultivator Publishing Co., 115 No. Broadway, Los Angeles.

FARM SCENES IN THE RICH ANTELOPE VALLEY, Cover.

DEEP WELL PUMPING A GREAT ADVANTAGE TO IRRIGATION, 539.

CITRUS AND SUB-TROPICAL FRUITS.—Keeping Qualities of Lemons; New and Promising Mango; Care in Picking; Fruit Trees Exhaust Soil; By the Trainload, 540, 541.

DECIDUOUS—Program State Convention; Soils Affect Quality; Tests of Spraying Codling Moth; Unite and Kill Them; European Vineyardists Catch Moths; 542,543.

SMALL FRUITS AND VEGETABLES.—This Month; Setting Strawberries; 544.

ORNAMENTAL GARDEN.—This Month; A Country Home; Fruit and Garden Notes, 545.

IRRIGATION AND FORESTRY.—Underground Irrigation; Resistant Pile Timber; How Forest Fires Start; Water in Alaska; 546, 547.

BEES AND THEIR CARE.—Bee Culture; Hiving New Swarms; 549.

EDITORIAL.—The Greatest of All Years; Our Greatest Crops; Teaching Plant Propagation; Next Week; Christmas Suggestion; Demonstration Train: 550.

AGRICULTURAL NOTES OF THE PACIFIC COAST, Northern, Central, Southern, The Coast, 551.

LIVESTOCK AND DAIRY.—Sorghum and Cereals; Care of the Dairy Cow; Scours in Calves; Cattle Ticks Lessen Yield of Beef and Milk; Does it Pay to Strip the Cows; 552, 553, 554.

PROFIT IN THE POULTRY YARD.—Line Breeding for Beginners; "Don'ts" in Turkey Raising; Fruit, Poultry and Bees; Charcoal for Hens; 555, 556, 557.

QUERIES AND REPLIES.—Borers; Topping Eucalyptus; Walnuts on Oaks; Walnut Varieties; Shasta Daisies; Cracking Walnut Seed; Milch Goats Valuable; Grapes Decay; Walnuts in Interior Valleys; Pruning Grapes; 558, 559, 560.

VETERINARY.—Kidney Trouble, Lumpy Jaw, 559.

HOUSEHOLD.—Lookin' Round a Bit; The Happy Secret; Black Bean Soup; Divisions and Subdivision of Commercial Cuts of Beef; How to Make and Fry Doughnuts; Virtue of Buttermilk; 561, 562, 563.

GENERAL AGRICULTURE.—Classification of Public Lands; Farming for Women; Smut Treatment; 564, 565.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 566, 567.

## Greatest of All Years.

THE THIRTEENTH ANNUAL REPORT of Secretary Wilson issued December 1, gives statements which show the past year the greatest of all years in agriculture of this country. He says:

Most prosperous of all years is the place to which 1909 is entitled in agriculture. The yield has been bountiful with most crops, and prices have been high. Advantageously situated as he is in most respects, the farmer is less and less generally compelled to dump his crops on the market at time of harvest. He does not need to work for his board and clothes, as he often did in the former time when prices were so low as to be unprofitable.

The value of the farm products is so incomprehensibly large that it has become merely a row of figures. For this year it is $8,760,000,000; the gain of this year over the preceding one is $869,000,000.

Ten years ago the value of the products of the farm was only five and one-half times the mere gain of this year over 1908; it was little more than one-half of the total value of this year. The value of the products has nearly doubled in ten years.

If the total value of the farm products in 1899, as established by the census, is placed at 100 the value for 1903 is represented by 125, for 1904 by 130, for 1905 by 133, for 1906 by 143, for 1907 by 159, for 1908 by 167, and for 1909 by 186.

Eleven years of agriculture, beginning with a production of $4,417,000,000 and ending with $8,760,000,000! A sum of $70,000,000,000 for the period!

It has paid off mortgages, it has established banks, it has made better homes, it has helped to make the farmer a citizen of the world, it has provided him with means for improving his soil and making it more productive.

## Our Greatest Crops.

SECRETARY WILSON says in his annual report, "The most striking fact in the world's agriculture is the value of the corn crop of 1909 in this country. It is about $1,720,000,000." He further adds that this corn crop nearly equals the value of the clothing and personal adornments of 76,000,000 people according to the census of 1900, and exceeds the value of the gold and silver coin and bullion of the United States. It is the greatest corn crop on record and exceeds the average of the preceding five years by 36 per cent. and the price per bushel is greater by 32 per cent.

Cotton is the second crop of the country in value though it falls to practically one-half the aggregate value of corn, or $850,000,000. Wheat comes third with $720,000,000; hay fourth, $665,000,000; oats fifth, $400,000,000. This latter crop exceeds the five year's average by 28 per cent. The sixth in value is potatoes, $212,000,000. Tobacco is seventh of about $100,000,000 valuation, and this is 50 per cent increase over the five year average and has brought to the growers the highest prices since 1883.

The value of the cane sugar of the country aggregates about $40,000,000, while beet sugar and pulp for feeding purposes aggregates about $47,000,000. Barley aggregates $88,000,000; flaxseed $36,000,000; rice 25,000,000; rye $23,000,000, and hops $8,000,000.

The farm value of all cereals in 1909 has never been equalled in previous years. It is almost exactly $3,000,000,000 or 35 per cent above the five year average.

## Teaching Plant Propagation.

POMONA COLLEGE located at Clarement, Los Angeles county, is out with a little folder announcing a departure in education at that institution in a course in plant propagation and planting under the direction of the department of biology. The particular topics to be considered are preparation of soil for seedbeds, planting seeds, variation of treatment for special seeds and special purposes, handling of seedlings, cuttings and layering, methods of budding, grafting, seed collecting and selection, storing, testing, etc. Advanced courses contemplated: Identification of plants, principles of orchard planting, principles of parking, street planting, construction of lawns, etc.

We believe this will be a wise step and can only suggest a more general course touching upon the principles of agriculture in a broader way than is outlined in the above summary of the course. This will no doubt come to this up-to-date institution.

## Demonstration Train.

PROF. W. T. CLARKE of the State University writes regarding the demonstration train trip just ended after tour of the Sacramento Valley; "We met with gratifying reception all along the line. The work seems to be valuable and undoubtedly is appreciated by our farmers." The trip covered a distance of nearly 800 miles, extending to the extreme northern part of the state. Another one is now planned which, according to the itinerary furnished us by Prof. Clarke, reaches Sacramento on the morning of December 14, visiting Auburn, Newcastle, Penryn and Loomis that day. December 15th it will be at Rocklin, Fairoaks and Folsom; December 16, Placervillie, Diamond Springs, Lathrobe and Sacramento. Starting again from Sacramento on the morning of the 17th it goes to Florin and Elk Grove; December 18, Galt, Acampo, Lodi and Stockton, remaining at Stockton over Sunday the 19th. On December 20 it visits Milton, Oakdale, Waterford, Montpelier and Merced; December 21, Atwater, Livingston, and Turlock; December 22, Ceres, Modesto, Ripon, Manteca; December 23, Lathrop; Tracy, Bethany, Byron and Brentwood. This makes a total distance for this trip of 392 miles.

Prof. Clarke will be in charge of the demonstration work. Speakers at places where public meetings will be held are Professors Wickson, Shaw, Major, Haring, Morgan, Jaffa, Bioletti, Burd, Loughridge, Smith and Quayle.

This work is made possible by the liberality of the Southern Pacific railway people who furnish the train complete and bear all the expenses.

## Poultry Number.

NEXT WEEK'S ISSUE of the Cultivator will be given up very largely to a symposium on poultry questions. A series of questions have been sent to breeders of different kinds of fowls in various parts of the state, and these questions have been quite largely answered and are now in type ready for next week's issue. The poultry industry in this state is important enough to be worthy of all the attention given to it by the newspapers, especially when one looks at the immense importations of eggs and poultry products and the large sums sent to the East to pay for them.

The obstacle in the way of the greatest success of this industry in California has been the lack of understanding of the industry by those who have engaged in it. The objection almost invariably raised is that "Feed is too high," but as will be seen by the questions answered in next week's issue, there are many people who are making a success of the business. They buy their feed no cheaper than others may, but they do go at the business with an understanding of its limitations and possibilities. For that reason we believe this number will be particularly valuable in showing methods employed by our successful raisers and some of the points to be avoided. Let us raise more poultry in California and import less.

## A Christmas Suggestion.

THE CULTIVATOR annual offer of subscriptions for Christmas presents is now in order. What can be more appreciated, in proportion to its cost, than a year's subscription to our paper?

Other presents cannot be the constant reminder of the giver that the Cultivator would be on its weekly visits.

In each case where our paper is intended as a Christmas gift we send, with the first number, an announcement of the gift showing the name of the giver. No present can be arranged for so simply and satisfactorily for all concerned. Merely enclose check or money order with order blank which may be found on another page of this issue, and we will do the rest.

As is stated on the order blank all Christmas or gift subscriptions are discontinued at expiration. This date is usually January 1, though we arrange to have the first copy reach the reader as near Christmas day as possible. Now is the time to send orders.

## Deep Well Pumping for Irrigation.

(Continued from Page 539.)

this time. There is a great deal of land in California, not irrigated as yet, where the water will have to be lifted not less than 200 feet and from that up to 300 to 400 feet and this will all have to be irrigated by deep well pumps.

In many places pumps are kept in commission all winter ready to operate at a moment's notice, especially in sections where there is apt to be frost, as it has been found that the water pumped from below the surface, being much warmer than the atmosphere, and run through the orchards on a cold night forms a mist or fog which spreads like a blanket over the whole orchard and prevents frost from affecting the trees or fruit.

From the foregoing it will be seen that deep well pumping has proven successful wherever tried. While still in its infancy deep well pumping for irrigation has accomplished a great deal in reclaiming arid and semi-arid lands, and is certain to become more and more in vogue as we become acquainted with its advantages and realize its place in our western development.

# Agricultural News Notes of the Pacific Coast

## Northern California

Certain land owners in Reclamation district No. 730 have appealed for the formation of a separate reclamation district.

Lincoln, Placer county, is developing a demand for its citrus fruits which are said to be exceptionally fine.

Water will be taken from the Yuba river for the purpose of irrigating about 4000 acres of land in the Cordua district.

The recent rains started plows in nearly all sections of the Sacramento Valley. The storm aggregated an inch and a half to four inches.

The demonstration train which made the trip through the Sacramento Valley last week was greeted by large crowds at nearly every stop.

San Bernardino business men are planing for the erection of a cotton mill in order to be ready to handle the cotton output of the Imperial Valley.

Rufus P. Jennings, for several years chairman of the California Promotion Committee, has tendered his resignation to take effect January 1st.

Calaveras county has a fruit grower who has been experimenting with grafting of walnuts on oak trees and he has succeeded in growing remarkably large fruit.

Rice threshing is under way at Biggs where over 100 varieties used in experimental plantings have been grown. The rains have done no injury to the crop.

The meeting of Placer county fruit growers called by the special committee of fifteen, was held at Loomis last week and the report of the committee accepted.

An exhibit of the products of Glenn county has been gathered by a Pittsburg syndicate and shipped to Chicago where it is doing good service for that county.

Shippers of potatoes in Alturas, Modoc county, are appealing to the Interstate Commerce Commission for relief from unjust discrimination in rates to Nevada points.

Unscrupulous dealers have used the cartons for covering so much inferior butter, that the more reputable makers in Humboldt county are discussing the advisability of discontinuing this expensive plan.

Apple growers at Fort Bidwell, Modoc county, were unable to ship out beautiful red apples because of lack of transportation facilities. Surprise Valley is one of the finest apple producing sections of the world.

Fair Oaks is shipping a small orange grove of a dozen trees, which will give attendants at the National Live Stock Show in Chicago, a little taste of California climate. From Chicago the trees will be taken to the Omaha Corn Fair.

The creameries of Humboldt county paid off their patrons on the 15th on the following basis: Central Creamery, Arcata 39½ cents for butter fat; United, 38½; Capital, 38½; Libby-McNeil Co., 39½; Sunset, 37; Grizzly Bluff, 38.

## Central California

Tulare County Citrus Fair is being held in Dinuba this week.

Kingsburg raisin growers have endorsed the new California Raisin Co.

Thirty thousand rainbow trout were planted in Kern county streams last week.

Work on the weir of Kings River has been discontinued on account of floods caused by the recent storms.

Co-operative marketing of apples by Prunedale apple growers has proved very successful during the season.

The California Dried Fruit Agency has secured a block of land in Fresno for the construction of a mammoth fruit packing warehouse.

It is rumored that the Armour packing interests have secured an option on the great Miller & Lux land holdings in the San Joaquin Valley.

The apple shipments from Pajaro Valley amount to practically 3000 cars, the greater number of course being shipped from Watsonville.

One New York apple buyer spent the season in Watsonville, purchasing over 300 cars of Newtown pippins, paying spot cash on delivery of apples.

One man at Fowler has been called upon to pay $160 balance for freight and expenses on an extra fine lot of raisins sent east through the farmers' union.

The district game warden located at Fresno will liberate a hundred Hungarian patridges in the foothills of eastern Fresno, Tulare and Kern counties.

Kerman's new co-operative creamery is becoming an assured fact and the directors are employing a contractor to superintend the work of construction.

Hanford has produced its premium pumpkin which weighs 200 pounds and is now shipping it to Los Angeles to show the southerners how to grow things.

Tule River, a new citrus section of Tulare county, claims the distinction of shipping the first oranges from the state this season. It is proving to be an excellent orange growing section.

The Raisin Day committee which made such a success of last spring's Raisin Day, has again taken up active work and is now inducing eastern bakers to make raisin bread a regular feature every day.

At the state meeting of the California Farmers Union it was resolved, "That we favor the speedy enactment of laws prohibiting the acquisition of our agricultural lands either in fee or by lease by those who will not or cannot become citizens of the United States."

There were no applicants for examination for county horticultural commissioner of Kings county. Action is being taken by fruit growers who are circulating a petition with the names of B. V. Sharp, J. E. Tilton, C. M. Blowers, A. C. Eccles, and A. W. Lane, from which to make the appointment.

## Southern California

Tustin expects to ship a few cars of holiday oranges.

Calexico proposes to have a cotton gin ready for the next season's crop.

San Diego county is constructing about 450 miles of first-class roadways.

Twelve hundred acres of cotton will be planted by farmers near Calexico in 1910.

The inner harbor of Wilmington received its first cargo since 1882 on November 23rd.

Lompoc, Ventura county, is starting in the apple industry and this year has shipped 25 cars.

The Citrus League is winning its way in the fight for lower freight rates on oranges and lemons.

Heavy shipments of celery began this week. The cool weather has been very favorable to the crop.

A large number of young fish have been planted in the Bear Valley reservoir by the state fish commission.

Some Southern California oranges are being shipped, those from Highlands especially showing good coloring.

All Southern California was visited by a fine rain the night of the 25th. It varied from half an inch to one inch.

The Southern California Sugar Company's sugar plant at Santa Ana closed with a record of 45,000 tons of beets.

A demonstration farm is planned for the San Fernando valley. It is called "Demonstration Acres" and will consist of about 1000 acres.

The California Development Company has begun reconstruction of the canals bringing water from the Colorado river to Imperial Valley.

The bean growers of Ventura county are up in arms over the manner in which the Armsby company are claimed to have handled the Eastern bean market.

Pomona College has established a course in plant propagation, and in connection with the school is a propagating place in charge of Prof. C. F. Baker.

Fillmore, Ventura county, recently held a celebration and barbecue over the completion of a fine steel bridge over the Santa Clara river between that town and Bardsdale.

Some members of Water Company No. 5 in Imperial county have been charged with diverting water from lands to which it was appurtenant to other lands not entitled to it.

Ventura is holding a street carnival, one feature of which is a banquet with every dish composed of beans, from lima bean salad and bean pottage down to bean pudding, bean pie and bean coffee.

The Armsby company are reported to have been interviewed in New York and to have said: "The lima bean farmer needs neither help nor sympathy." Perhaps this is also the attitude of the bean men toward the Armsby company.

## The Coast

Klamath Falls, Oregon, Grange Patrons of Husbandry was organized last week with 22 charter members.

The farmers union at Mansfield, Washington, has succeeded in getting a most satisfactory price for wheat for its members.

A campaign for water conservation and irrigation development is to be taken up in Oregon so as to insure more regular crops.

Wheatgrowers at Waterville, Washington, are compelled to store great quantities of wheat because they can get no cars to handle shipments.

The Hawaiian Sugar Planters' Association recently held its annual meeting in Honolulu and received reports which indicate an immense crop of sugar.

U. S. Experimental farm located near Yuma, Arizona, secured many first premiums, especially on exhibits of growing cotton, at the recent territorial fair.

The sweepstakes winning on apples at the National Apple Show went to Rogue River, Oregon, apples. North Yakima, Washington, was a close second.

The display and the crowds at the National Apple Show at Spokane were even greater than anticipated, and the show was declared a success in every sense.

The Coquille Valley Fruit Growers Association and Coos Bay Association, at Marshallfield, Oregon, have sold their winter apples to one fruit buyer of Seattle.

Arizona stock growers are requesting the territorial legislature to enact laws providing a penalty for failure of railroads to provide proper and adequate stock cars.

Nine years ago a farmer in the Hood River Valley, Oregon, bought 40 acres of land at $15 per acre. The entire tract was set to apples and today is valued at $1500 per acre.

The state experimental farm at Union, Oregon, has been experimenting for several years with grasses and grains, and will this year begin the purchase of thoroughbred livestock for experimental purposes.

Apple growers at the National Apple Show at Spokane, protested against the change of name of the old favorite apple, Rome Beauty, to Roman Beauty. They maintain that Rome Beauty is the only correct name.

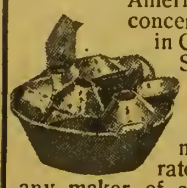
One feature of the National Apple Show at Spokane was Country Life Day at which a committee was appointed and charged with the duty of securing from governors of the Pacific Northwestern States a joint commission on country life.

At the fifth annual meeting of the Arizona Cattle Growers' Association at Phoenix recently, the following officers were elected: W. W. Cook, Phoenix, president; Wm. M. Riggs, Dos Cabezas, first vice-president; Fred Colter, Springville, second vice-president; O. H. Christy, Phoenix, treasurer; F. W. Wilson, Phoenix, secretary.

# Pans Tell

One dishpan shows the only piece used inside Sharples Dairy Tubular Cream Separator bowls. The other dishpan shows the disks from a common separator bowl.

Is it not easier to handle, wash and turn the light Dairy Tubular bowl? Is it not common sense to expect the simple Dairy Tubular bowl to run steadier and resist rust, knocks and wear longer than a common bowl with a dishpanful of disks inside? Of course it is.



World's biggest separator factory. America's oldest separator concern. Branch factories in Canada and Germany. Sales easily exceed most, if not all, others combined. Tubulars probably replace more common separators every year than any maker of such machines sells.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

### SORGHUM AND CEREALS.

By Mrs. M. E. Sherman.

THE GERMAN dietitians say that in America we make horse feed of the best vegetable that grows, namely, carrots. We also turn aside as human food the grains of the sorghum plants. If Mr. Hill's cry of the scarcity of food that is confronting the world in the decreasing wheat crop is true, we will find food in the sorghum plant. China and Turkestan use the seeds of the non-saccharine sorghums largely as food, while no doubt, Mr. Roosevelt has eaten of the bread made in Africa from the flour of these corns ground in the native mills. I always think one of the interesting things about going among foreign people is the complete change of foods, if we are wise enough to live as the natives do in every country visited. When I leave the United States I like to leave behind me the ways of a United Statess. I presume that will answer for the feminine form of the word.

The two types of sorghums are the saccharine and the non-saccharine. The saccharine sorghums contain much sugar and make a sweetly sour syrup. This was common when I was a little girl in the East owing to the high prices of sugar and the lack of money in the farming districts. It is a thought worth while, when it is considered how independent we are after all on a farm when we can grow our sweetening in one season and can make coffee out of browned sweet potatoes flavored with chicory. The only food I could not grow a good imitation of in one season would be tea. I mean the only food in everyday use, not the rarer condiments and tropical fruits.

Sorghum is represented in the sweet or sugar types by the early amber cane. This comes under several forms but is not as mixed up as the non-saccharine corns. There is little unmixed seed to be found of any form of sorghum in the market. I have had to keep sorting the heads as they grew in the field, and after four years have gotten rid of broom and kaffir corn mixture. These are not as valuable for cow feeding as the sweet sorghum, as they have woody, pithy stems and are not eaten up clean. When made into silage the cattle reject a large portion of the stalks. The woody character of these stalks is found when the waste is thrown out to rot. I have had them in a sink hole that had water in it for two years and they lasted as long as the grape vine brush.

Milo maize, kaffir corn, doura and the rest, are often sold one for the other in the market. Egyptian corn also has its varieties, red, white and black according to the color of the seed. The white is the most valuable as it has harder kernel and ripens better. It also shells easier as the birds know. A crop of it is often harvested before the owner can reach it by these busy little ones. The red corn does not harden up as well and while the birds do not trouble it greatly, it is not as valuable as it will not keep very well. The black is worthless as it is too soft to keep. All these corns may be fed in the head without thrashing, to horses and stock cattle. When in use for cows it always seems to cut down the milk flow if fed in the head. I have fed it by soaking it soft and mixing it in with the grain food, making the food wet enough to cling together, but not a slop. The greatness of the sorghum crop is hardly realized in the San Joaquin Valley, yet it should be a crop planted in all portions where the irrigation water is not abundant. In Kansas where it is too dry to grow wheat there are planted two hundred and fifteen thousand acres of kaffir corn alone, Egyptian corn nearly half as much, and the other corns as milo maize and brown doura, about one-quarter more.

I saw one of the new sub-varieties sent out by the Government the other day at Modesto. It was sent to several farmers by Mr. Needham under the name of Dwarf Milo Maize. The seed heads are nearly solid, they are so densely full of seed. The color is white and the kernels seemed hard and well cured to the center of the mass. The height of the crop seen from the auto looked about five to six feet as it stood in the field. The heads brought into the house were more closely examined. I was sorry I did not weigh them. This corn seems to be valuable as it was not destroyed by the birds and gave three times as much seeds to each head as average Egyptian corn. Ordinary milo maize at the Louisiana Station gave a yield of thirty-nine bushels of seed and thirteen tons of cured fodder to the acre.

#### Other Considerations.

Sorghum is undoubtedly hard on the land because it draws out the moisture. It is as gross a water gatherer as the eucalyptus tree, and like it will make a growth on a minimum if it has to do so, but it will rustle all the moisture in the neighborhood. On the heavy, too wet soils on the ranch this property has proved of value. On a field that is disposed to be boggy a crop of sorghum makes the soil easier to handle the next winter.

Now as to the cereal crops that should go into the ground at once for winter pasturing of the cows: Rye will come the quickest into a thick green growth, then barley comes next with wheat and oats to follow. These can be sown in small lots of an acre and fed down for a couple of months, then allowed to grow into a hay crop. We should try to do more of this form of cropping in California instead of allowing the stock to tramp the life out of the alfalfa fields during the winter months. Rye and barley fed green are apt to taste the milk, but this of course is all outside of the cow. Milk is sterile except in diseased animals and tainting comes from outside influences. The cows should be brought in and allowed to eat hay or other food in the cor-

When writing advertisers, mention Cultivator.

ral for a couple of hours before milking time. It is so very simple to control these bad flavors that they are inexcusable in milk. Oats can now be sown with peas and makes one of the most valuable crops of all for the cows and horses. This too may be pastured for a couple of months and then let grow up for hay. It should be cut when the oats are in milk stage of ripeness without regard to peas. When this is made into silage the turkeys soon find the peas and it is amusing to see the cows and turkeys scramble for them. The turkeys will almost get on the cows' heads in their eagerness to pick out the peas.

Another summer crop I have never seen in my neighborhood is teosinte. This looks and acts like sorghum, but is even a heavier cropper, going as high as fifty tons to the acre. The difficulty with all these crops is in the seeds. They are expensive at first and it is a mistake to buy more than enough for half an acre the first year. Then select the seed from it yourself for the following year's seeding. One of my neighbors told me he paid twenty cents a pound for sorghum seed. This seemed to me terrible, for good fairly clean seed sold for $40.00 a ton while common mixed seed brought $30.00. I am anxious to see his seed to find if it was so much better or if the local merchant simply soaked him as a faddist.—M. E. Sherman.

## CARE OF THE DAIRY COW.

If the dairy cow is worth caring for at all she is worth caring for well. That is my text. On that platform I have seen men start out in life as renters with a few cows and in a comparatively few years be farming their own land and be rated among the most prosperous and influential farmers in the community.

On this same platform breeders of dairy cattle have made their herds famous and others have set records in production from time to time. If the man who cared for the cows in the St. Louis World's Fair test hadn't been of a mind to do things to the best of his knowledge while he was doing them, he would never have discovered and made a record with that now famous cow, Loretta D. I never expect to raise any cows myself that will ever produce, say, more than 400 or 500 pounds of butter a year, and some who read this may think that it is foolish to try to learn anything from these extreme examples of what good care will do for a cow, but on the other hand, I believe that a study of them is the best use to which one can put his spare time. They show us the possibilities. We can then decide what is possible for us to do and plan and work accordingly.

How this famous cow was cared for in order to average 42 cents a day net profit on butter is interesting, even though it has been told a good many times. It is said that she was an animal plainly showing her likes and dislikes. She was particularly fond of alfalfa hay and ate more by far than any other cows in the test. The feeder soon found this out and always saw to it that she was well supplied. He further found that she liked corn meal and oats probably better than any other grain combination, so she got a good allowance of that regularly. It was also found that she had likes and dislikes in other things. For instance, in the way she was watered and the time she was milked. I presume she didn't like to be milked when she was eating. At any rate, the fact remains that her peculiarities were found and catered to, and for that reason, probably as much as for any other, she made her record.

Now, how can we apply the lesson? I do not mean to the care of any one cow, but to the care of the whole herd. It is not an uncommon practice with many farmers in this section, and I know it is true in many other parts, to allow the milch cows to run with the stock cattle and horses. Now, good cows, as I have observed them, are the most docile creatures on the farm and like to roam around the yards or go out to the fields in their own good time. Whenever they have to run with the other cattle they cannot do this. They are crowded out at the watering trough, horned and chased and hurried through gates. Thus their energies are directed from the digestion of food and the making of milk to things which do not profit. For this reason I believe that it will pay every man to have a separate lot for his cows where they will feel secure from annoyances of this kind. I know it pays me.

Inside the stable, stalls and stanchions ought to be arranged so that each cow can take her own good time to eat without being hurried, lest the cow next her should get through first and begin to steal. This is sure to happen if any kind of systematic feeding is done, as some cows will need more grain than others. The privacy of each cow, of course, is a matter of stable arrangement. In this connection I want to say that I do not like the common plan of having cows and horses stand face to face, separated by an alley. I believe cows and horses ought to be in saparate parts of the barn. When cows are comfortable, I feel that they are being cared for just about right, and comfort, it is needless to say, is gained only when the cow is amply satisfied at the feed box and rack and protected from factors which will disturb her in any way.—Des Moines Homestead.

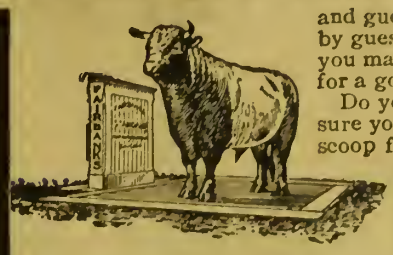
## WHITE SCOUR IN CALVES.

Having often noticed inquiries in various papers for remedies for White Scour in calves, perhaps a method of treatment I have followed may be successfully adopted by others. With us the egg cure is the most effective of all we tried. Sometimes the calves would be so bad that they could only lie on their sides and pant.

We would break an egg so that it would pour nicely, and slowly empty it down the calf's throat out of a gravy boat or anything handy. An egg was given three or four times a day; sometimes it would take, perhaps, 3 dozen to make matters right but eggs are usually plentiful and cheap when scours are prevalent. As soon as the ailment is noticed, reduce the milk allowance to quite half, and when very bad give nothing but eggs, gradually coming back to the milk allowance. Clean, warm and dry quarters are necessary for young calves. I think White Scour is most prevalent during the wet weather in early spring, especially if hot and muggy.

For any looseness of the bowels, we mix, say a pint of lime water in

# Would You Give a Handful of Money



and guess you had paid the right amount? Yet, by guessing the weight of your stock and produce you may lose enough money every year to pay for a good scale.

Do your weighing as you do your paying and be sure you are right. Does your grocer give you a scoop full of sugar and guess at the weight? Hardly. He carefully weighs everything you buy from him. Employ the same methods of economy when selling your products. Know the weight of your produce and get pay for all you raise.

Have reliable **Fairbanks Scales** to protect and save money for you and help you get ahead. They will last an average lifetime, and be as reliable and accurate the last day as when they were bought. We can refer you to many Fairbanks Scales put in over sixty years ago, which while weather beaten and old looking are still accurate and giving good service. # MOVING PICTURES

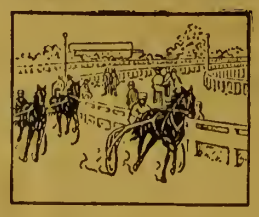
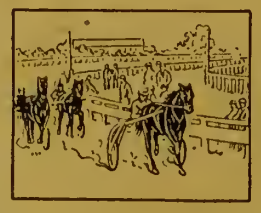
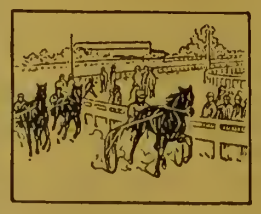
OF THE WONDERFUL WORLD CHAMPION

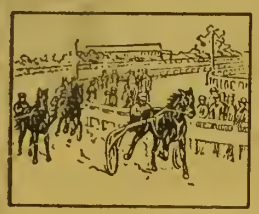
## DAN PATCH 1:55

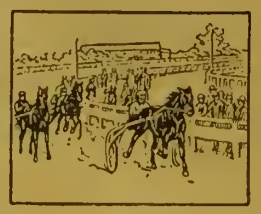


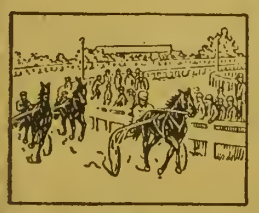
ABSOLUTELY **FREE** POSTAGE PAID











THIS IS THE LATEST HORSE SENSATION AND GREATEST TRIUMPH IN THE MARVELOUS AND REALISTIC MOVING PICTURE ART.

It is a New Invention that you can carry in your pocket and show your friends instantly, day or night, either once or a hundred times and without a machine, curtain or light. It is the first successful moving picture ever taken of a World Champion Horse in his wonderful burst of speed. A marvelous race sensation.

**A MILE OF THRILLING RACE PICTURES**
**2400 MOVING RACE PICTURES OF DAN PATCH 1:55**

and every picture shows the King of all Horse Creation as plainly as if you stood on the track and actually saw Dan Patch 1:55 in one of his thrilling speed exhibitions for a full mile. 2400 distinct moving pictures taken of Dan in one minute and fifty-five seconds means twenty-one pictures taken every second all of the way around the entire mile track from the back seat of a high power automobile. You can see Dan shake his head to let his driver know that he is ready for a supreme effort and then you can watch every movement of his legs as he flies through the air with his tremendous stride of 29 feet. You can see his thrilling finish as he strains every nerve to reach the wire, you can see his driver dismount and look at his watch while thousands of people crowd around, you can see his caretaker force his way through the crowd and throw a beautiful woolen blanket over Dan to prevent his catching cold and then you can follow him up the track before the madly cheering multitudes. As a study of horse motion it is better than the actual speed mile because you can see Dan right before you for every foot of the entire mile. When first shown to the public this marvelous picture caused people to stand up all over the theatre calling "Come on Dan"—"Come on Dan."

This remarkable moving picture is the most realistic and the most thrilling ever presented to the public. My Free Offer Subject To Withdrawal Without Further Notice.

I have taken a part of the original 2400 wonderful and sensational pictures and made them into a Newly Invented Moving Picture that you can carry in your pocket and show to your friends at any time, day or night. It does not need a machine, it does not need a curtain and it does not need a light. It is all ready to show instantly either once or a hundred times and Creates A Sensation Wherever Shown.

**THIS MOVING PICTURE WILL BE MAILED TO YOU ABSOLUTELY FREE, WITH POSTAGE PREPAID, IF YOU ARE A FARMER, STOCKMAN OR POULTRY RAISER AND CORRECTLY ANSWER THE THREE QUESTIONS.**

If You Are A Farmer, Stockman Or Poultry Raiser I Require A Correct Answer To These Three Questions. ——→ You Must Answer These Questions.

**1st.** In what paper did you see my Moving Picture Offer? **2nd.** How many head Each of Horses, Cattle, Sheep, Hogs and Poultry do you own? **3rd.** How many acres of land do you own or how many acres of land do you rent?

☞I Personally Guarantee To You One Of These Wonderful Moving Pictures Free If You Are A Stockowner And Answer These Questions And Write Me Today. Signed—M. W. SAVAGE.

**IF YOU ARE NOT A STOCKOWNER AND WANT THE MOVING PICTURES SEND ME 25 CENTS FOR POSTAGE**

Packing, etc., In Silver or Stamps and I will mail you this Wonderful Moving Picture of Dan Patch 1:55, the fastest harness horse the world has ever seen.—If you send me Twenty-five Cents in Silver or Stamps—EVEN if you do not own any stock or land, I will mail it to you postage prepaid. Reproduction cost me thousands of dollars.

the calf's feed for a day, but with the poddies always give the eggs for the curdy and bloody stage. We place the affected animals on a bag out in the sun and persevere with them, and I have seen some very bad cases recover; in fact, we rarely lost one after the treatment described.—Journal of Agriculture of Victoria.

## CATTLE TICKS LESSEN YIELD OF BEEF AND MILK.

A cattle tick that has reached the engorged stage weighs about 5 grains, and about 1,500 such ticks weigh a pound. As cattle in the tick region often carry many thousands of these blood-sucking parasites, and as each tick during the period of its attachment to an animal draws considerably more than its own weight in blood, it can be seen that these ticks constitute an enormous drain on the cattle which they infest. This accounts for the fact that under such conditions it is impossible to fatten cattle even on rich pasture and with an abundance of good feed. A large part of the nourishment that should go toward producing beef and milk is consumed by the ticks. In addition to the loss of blood and nourishment there is the never-ceasing irritation caused by the ticks, so that the existence of the infested cattle is beset with continuous suffering, and this of course also tends to keep them in poor condition.

The shrinkage in the milk production of a cow harboring many ticks will average one quart a day, and the loss occasioned thereby at 3 cents a quart for the 875,000 ticky dairy cattle out of more than 4,000,000 below the quarantine line would amount to $26,250 a day. Counting 300 milking days for each cow to the year would make the loss from this cause $7,875,000 per annum.

## DOES IT PAY TO STRIP THE COWS?

Look at the figures below, which are the averages taken from ten different cows' milk tested separately immediately after six consecutive milkings, and then decide for yourself:

No. 1.—Average test of first pint of milk drawn, 1.38 per cent.

No. 2.—Average test balance of milk, except final strippings, 3.35 per cent.

No. 3.—Average test of last pint of strippings, 8.72 per cent.

The strippings from one of the cows tested 12.5 per cent butter fat.

Every milker succeeds in getting the milk shown in No. 1 and No. 2, but the careless and thoughtless milker does not get the milk shown in No. 3. The result of this neglect and carelessness on the part of the milker is detrimental to the owner in the following ways:

1.—A shortening of the cow's milking period.

2.—A material loss in the number of pounds of butterfat the cow produces in a year.

3.—A considerable loss in the number of pound of milk the cow produces in a year.

4.—A much greater danger of the udder becoming diseased and ruined for milking purposes.

Are you getting that last pint of strippings from each of your cows, which is such an important item in determining the final results of profitable dairying?—Hints and Helps.

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

# Profit in the Poultry Yard

## LINE-BREEDING FOR BEGINNERS.

By Mrs. Frank Metcalf.

LINE-BREEDING is keeping in line with the blood of one family until one perfects a strain of fowls that will be prepotent and reproduce their kind, which can never be done by continual out breeding.

Strains and families have been bred in line for more than twenty-five years without a drop of fresh blood being introduced, and have increased in vigor and fine qualities until the owners would as soon think of going out of business as of using a bird not related to their own. This can only be done by painstaking and particular people, and only those with a scientific turn of mind can succeed for so long a time without trouble. I will briefly outline a plan whereby one can begin this interesting study and sketch out for a rough guide a chart which I think can be easily understood. We must also have a chart for the toe-marking of the chicks, and will find a small punch indispensable. The toe-marking must be done while the chicks are a day or two old, lest they bleed and the others learn to peck at the blood and get into cannibal habits.

A book must be kept for this one purpose; to keep a record of each chick's pedigree by putting down its particular toe-mark, and the pen it was from, as soon as the hatch is taken off. Then when mating time comes, it is a simple matter to select our breeders, and mate them according to rule. Usually the way one begins is to select the very best pair one can procure of the chosen breed, although a trio or pen would be equally as good, and the results be the same if all proved to be good breeders, but we will start out as though we had just the one fine pair.

For the sake of having a name, we will say the cock is called Darby and the hen Joan, and that they are both birds whose excellent points we wish to perpetuate. The female is supposed to determine the shape, and the male the color of the progeny, but we want just as few faults in this, our first pair, as it is possible to find. While the influence of one parent may counteract the deficiencies of the other in the first generation, in succeeding generations we may find a crop of these faults spring out in unlooked for directions, just as insanity may skip one generation in the human family only to crop out in the next, etc. It is well to leg-band the first pair with a pair of sealed leg-bands, numbered, and with the number written down at the beginning of our Record book.

The first year we should raise all we can from this pair, and toe-mark them say, between the first and second toes of the right foot, the chicks being one-half the blood of sire and dam, respectively.

Reserve only the best birds, and save an extra cockerel or two which you may either farm out or mate with your less desirable pullets and use those eggs for culinary purposes. The second year we mate the male, Darby, to this best daughters, and the hen, Joan, to her best son, toe-marking the chicks, say, Joan's chicks in the left foot, between the first and second toes, and Darby's between the second and last toes, right foot. Darby and daughters we call pen 2 A, and Joan and son, Pen 2 B, and the progeny from this lot, will be three-quarters the blood of either dam or sire, as the case may be.

The third year we mate four pens; Darby to grand-daughters, Pen 3 A. A. and Joan to her best grandson, Pen 3 B B. Also the best son from Darby and daughters to his mother pen, and Cock from Pen 2 B to his own daughters. These matings intensify the line on each side, so that now our A, or male, side has seven-eighths the blood of the sire, and the B, or female side has seven-eighths the blood of the dam.

The fourth year, if Darby and Joan are still worth while, they may be mated together again, but as something usually happens by this time to one or both, I have arranged as follows: Pen 4 A to consist of cock from pen 3 A to his daughters, and pen 4 A X, (one of the reserve force of cocks which should be saved every year) to pullets that are really his nieces. This mating is original with me so far as I know, and I found it excellent for vigor and other good results. Now if we take a cockerel from our pen 4 A A, and mate him to pullets from pen 3 B B, and vice-versa, as per chart, we bring the blood of the sire and dam together again, and the progeny of these two matings would be the same as the blood of the original pair. If this mating produces as fine birds as the first pair were, and continues the size and laying qualities as it should, the mating should be continued for as long as the birds produce well, and the progeny be used on either side in the mating of as many pens as we care to handle only taking care to always mate birds of different ages, say cocks with pullets and cockerels with hens, still keeping a record of the toe-marks for guidance, and remembering that each marriage of an A to a B brings them more like brother and sister, and keeping the male line and the female line exactly as in the beginning. As our Standard changes every five years, sometimes it is well to have fresh blood on hand, providing we may need it, to gain a certain point in which our strain may be lacking.

Now, to introduce fresh blood properly, one should select a well matured pullet from a flock that is strong as a flock, not as individuals, in the point we wish to emphasize. Mate this female to our finest male. and one on the reserve force, if possible, and note the progeny, whether it "nicks in" with our own or not. If it is not entirely satisfactory, yet shows a goodly number having the point we are after, we may mate her daughters back to their own sire and the progeny from this second mating should be sufficiently safe to mate with part of our own flock. Lest there should be some latent defects that this mingling of blood should bring out, we should keep part of

# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***

***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

## Petaluma Incubator Company

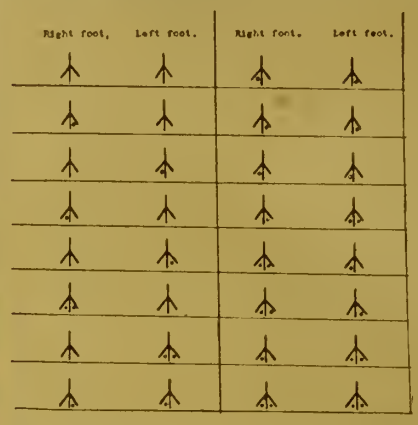
When writing advertisers, mention Cultivator.

our flock pure from this out-breeding, and we will then be on the safe side should bad results follow. Never use a male bird for out breeding unless you are perfectly sure that the general flock from which he came is superior to your own, and do not be disappointed then, if the progeny is not up to the mark. And be sure of the ancestry of your "fresh blood" too. I remember once looking about for fresh blood for my R. I. Reds. A man in Illinois offered me some fine ones in exchange, sent feathers and description, showing that he "had the goods," and I only waited to know where he got his stock before making the exchange." He got them from a preacher in Iowa," giving name and address, and here they were the very identical birds I had sold this preacher a couple of years before, and which I came so near getting back as fresh blood again. Fine birds they certainly were, but not at all what I needed.

I have not outlined the different toe-markings, as one can do that by the chart to suit one's self, there be-



ing 16 different ways of marking the web of the feet so one can vary the punchings as he wishes. As one studies the system, different matings may be evolved, and the work will become more fascinating every year.

A few don'ts must be added or this would not be complete. Don't let your cull cockerels run with your best pullets to maturity which comes at from four months old upwards. Don't expect to raise pure bred stock if your hens and pullets ever have strange males visit them. Contamination of the female may last her lifetime, for the blood of the embryo chick and the blood of the hen commingle before the shell is formed upon the egg, just as surely as does the blood of the embryo mammal and dam commingle, thus allowing the dam, through her unborn offspring, to partake of the blood of the sire.

The inbreeding phantom, and the fear of consequences therefrom have caused more disasters in the fancy poultry business than anything else. To be sure, injudicious inbreeding, by which cockerels and pullets of the same age and from the same stock are bred together year after year, will eventually reduce the size and vigor to a great extent, but the line-breeding as outlined in the chart, can be carried on successfully for a much longer period than a novice would believe. In introducing fresh blood, one cannot always tell just what trouble is in store. I will cite one instance from my own experience to show how mischief may be done, when one feels quite sure one is on the safe side.

Two years before I wished fresh blood for my Buckeyes, I had sold to an enthusiastic young breeder, a fine pen of line bred Buckeyes from one of my best families. Now, I reasoned that it would be perfectly safe to use a fine cockerel or two from that pen in my own flock, as they were just what I wanted to strengthen certain points in another family line, so bought as fine a bird as the owner would sell, and he was a beauty, and just what I seemed to need. I mated him with some of my best females, and was surprised to find that the mating threw chicks that were partly white. Not a decent chick did I get from the mating, and when that beautiful, dark red rooster molted, I noticed a queer appearance about him, for he looked as though some one had thrown snow or flour all over his back in patches. I caught him and found the white spots were new feathers, purely white, which did not appear in his first coat at all.

Inquiry developed the fact that the young man had a pen of white Rocks on the place, and during the months when no eggs were wanted for hatching purposes, it was his plan to let all his chickens run at large, trusting to a couple of weeks mating before saving the eggs, as being sufficient to make those eggs pure again. And authorities have maintained for years that this was sufficient. The results above prove how fallacious that theory is.

If there are undesirable roosters prowling around, shut your hens and pullets safely away from contact with them, or your hopes of fine-bred stock will go glimmering. And, after all your care and trouble, and you have a flock which will reproduce its top-notch qualities year after year, so that even culls from your birds will produce better birds than the best looking birds from carelessly bred flocks, how hard it is to feel Christian towards the expectant buyer, who wants the very best birds you have, and who offers you $1.00 a head if allowed to pick them out himself; or to the other well meaning fellow who will "trade eggs with you" and select for your benefit the smallest ones he has, and makes the remark that "fancy feathers look well. but they don't pay." Truly the fanciers fate is a varied one, and he does not reach the top round of the ladder on a "flowery bed of ease" by any manner of means. But he has his moments of satisfaction, and the best possible reward of earnest effort is the ability to do.

## "DONT'S" IN TURKEY RAISING.

It would be difficult to tell all the "Dont's" in turkey culture. The most prominent of all is: Don't breed from stock that lacks vitality. Blackhead is prevalent among turkeys, and it is almost certain to come into the flock where vitality is lacking.

When the poults are hatched, be careful that they are free from insects. Lice are found on the head and neck of turkeys, between the feathers of the wings and close up under the wing against the body. These insects destroy many young turkeys.

Do not permit turkeys to run in the damp, wet grass until they are at least four weeks old. The first food for the young turkeys should be bread crumbs with a little rolled oats, just a little at a time frequently. Keep the turkeys confined where they can not wander away, and do not give them moist food or heavy grain at first. Where a large number are grown, the heads of the young are rubbed over with sweet oil, lard, or vaseline, to insure against the pres-

ence of the insects. Some declare that one little turkey must die for every five head lice found in the flock. They crawl into the rough places about the head and neck and suck the blood from their bodies.

After they are a week old, the turkeys should be fed with bread crumbs, chick food, finely cracked corn, and broken wheat, the same as young chicks are fed. Some recommended feeding hard-boiled eggs. This is not best until after they are two weeks old. When hard-boiled eggs are fed, the eggs should be boiled at least thirty minutes, then ground up very fine, shell and all, and mixed with equal parts of bread crumbs and oatmeal. After this, hulled oats, broken wheat, and finely cracked corn may be fed. A small portion of milk curds is good for the young poults; too much of this will destroy them—a tablespoonful to a dozen is sufficient at a time. As soon as young turkeys are able to fly onto a fence to roost, they are past all ailments caused by water or insects.

Don't feed your turkeys wet mash, raw corn meal moistened with water or milk. Don't give the small turkeys whole wheat and large pieces of corn until they are fairly well grown. Don't permit the mother hen to lead them away while the grass is wet.

Some follow the plan of breaking up broody turkey hens when they first show signs of broodiness. If this is done successfully, they will lay again, and then they are permitted to hatch their own eggs, the first eggs laid being hatched under ordinary hens. Turkeys raised by the latter will wander away with the other turkey flocks as they become partly grown. Turkeys hatched June 1 often do better than those hatched earlier.

Eggs laid by young turkey hens that are 2 years old or older are superior to those laid by the birds in their first year.—N. W. Poultry Journal.

### FRUIT, POULTRY AND BEES.

Poultry husbandry, fruitgrowing and beekeeping form a combination that cannot be commended too highly. Each branch in its fullest and most profitable development is dependent upon the other and together they form an ideal occupation for a person who enjoys country life, but who is not rugged enough to undertake the work of conducting a more extensive system of agriculture.

The poultry will destroy thousands of harmful insects, thus they greatly benefit the fruit trees and increase the prospects for fruit, while the poultry themselves will gain great comfort and benefit from the protecting shade of the trees during the warm summer weather.

Plum trees and cherry trees are especially adapted to the poultry yard and are greatly benefited by the presence of fowls about their roots. Peach trees will grow more rapidly and soonest provide an abundant shade. With all our spraying and trapping, the insects do get past us. The fowls may not get all that remain, but they and the little chickens will get many of them. Poultry like the fruit and fowls in an orchard will eat the immature fruits as they fall and in doing so they kill off the the worms that caused these fruits to fall prematurely. Have you ever watched a flock of little chicks in an orchard? They are all the time chasing and hunting insects, many of them so small we can hardly see them, but we know when a tiny chick catches one by its self-satisfied manner. The chicken has perhaps saved a number of apples and the insects and exercise go to promote a healthly development of the chick. The fowls also destroy the root enemies of the tree and they do it without damaging the rootlets as is oftentimes done by a thorough cultivation.

Many a fruit grower fails to properly cultivate his orchard for fear he will peel the trunks of the trees and damage the rootlets by doing the work. Just cut the soil under the trees and scatter fine seed and the fowls will do the work just right. They will also enrich the soil while they are doing the work. We may take two trees of the same age and size and plant one in the poultry yard and one outside and in the difference in the vigor and growth can be noted at the end of the season.

The person who has a fancy egg trade will find that his regular customers are the very ones who most want choice fruit and fresh honey and they are the people who have the ready money to pay for all they get. By practicing these three branches we eliminate the profits of all the middlemen and derive every cent there is in the business. The person who has learned that it pays to put up nice, clean, fancy eggs is just the man to handle the fruit and honey in a manner so that people will buy it, whether they really need it or not. There are people who want the best regardless of price and they are the ones it pays to deal with every time when we have a prime article.—Portland Oregonian.

### CHARCOAL FOR HENS.

There is nothing better to keep fowls in healthy condition than charcoal. Indeed it will astonish one not accustomed to feeding it to see the quantity the birds will eat, if it is kept where they can get it if wanted. It will keep their digestive organs in good working order and overcome in a great measure mistakes in feeding or over-feeding. A sour, hard crop and drooping head with purple comb is seldom seen where hens have charcoal. If there is any clearing of land, burning of brush, and old logs, the charcoal may be procured there by drenching the fire with water as soon as it is burned down to coals. These, broken to the right size, answer the purpose very well and hard-wood ashes in which are small pieces of coal from the fire are much liked by fowls. A shallow box filled with such ashes will materially decrease in a short time and seem to exercise the same power as charcoal.

Coal ashes are liked to dust in and fowls will eat the hard stony pieces of a size that they can swallow, but they are not so healthful as charcoal or hard-wood ashes. In buying charcoal get the coarse ground kind and place it where the birds can go to it at will. If the powdered kind is used it must be mixed with the mash and is not so nice to handle.

Chicks, if allowed to, will often eat too much and die of indigestion. This may be prevented by plenty of charcoal and sharp grit.—Successful Farming.

---

Incubators will pay for themselves, if you try them.

---

The best way to get early chicks is to hatch them in incubators.

---

It is easier to keep poultry healthy than to try to cure sick birds.

---

Now is a good time to pile up some road dust for the winter.

---

Wet weather is not the best for poultry, and a wet roof is worse.

---

Make the hens come up to the scratch and keep them scratching.

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Borers—Peaches.

What is the trouble with our peach trees? The branches big and little suddenly die at any time of the year. The balance of the tree lives. Can you tell us anything about the Smock and Stump the World peaches, their color and quality, and with what peaches do they ripen?—Chaparral, Riverside.

The sudden dying of the branches may be due to borers and perhaps in most cases this is the case. Some seasons, however, sour sap has caused parts of a tree to die sudenly. It is no doubt caused by some bacterial disease. There is no remedy that we know of. Fortunately it is never very serious.

Smock is a late yellow freestone that comes on just ahead of and sometimes with Salway. Stump the World is a late summer freestone, white flesh with some red at pit. One of the finest table peaches. It is well named.—J. W. M.

### Topping Eucalyptus.

I have 150 eucalyptus trees planted along the roadside 16 feet apart. The trees are two years old and about twelve feet high. It seems to me that the trunks are too slender (some of them being not more than an inch in diameter) to support the tops through the winter storms. I have them supported with small stakes about three feet high, but will either have to trim them back or put in large stakes which would be somewhat expensive. —J. G. M., Sacramento.

We would cut off the tops of these trees to prevent them from being so top heavy. This is usually done to make the trunk more stocky and save the young tree being whipped to death or at least out of shape in the winter. We have seen trees where one-half to two-thirds of the tree has been cut away, leaving the stocky young trunk which next spring sent out a magnificent growth and at the same time made a more shapely tree.

### Walnuts on Oaks.

I note news item regarding walnuts having been grafted on oak trees. Is this true? If so, is any special process or treatment required? A. B. C., Escondido.

This is a hard question to answer. The item referred to was taken from a Northern paper. We imagine this is a new field which will require some little experimentation before anything very definite can be known about it. We will admit being a little skeptical as to its commercial success, if it is a possibility.

### Walnut Varieties.

What is the advantage claimed for the different varieties of grafted walnuts such as the Franquette, etc.?—X

The Franquettes have proven fairly satisfactory in some northern sections where the soft shell varieties which do well in the southern counties would not succeed at all. Where the Eureka, Placentia Perfection, or Santa Barbara softshells and a few of the imported will do at all, the Franquettes would not be worth planting. In sections where frost may come later and injure the early blooms, the Mayettes and Franquettes have proven good bearers and have done very well. The matter of variety to plant may best be determined by noting the kinds planted in your own community. Whatever is doing well there at the present time should be continued.

### Shasta Daisies.

Please give me time of sowing Shasta daisies and length of time from sowing to bloming. Where can I get the seeds, and what is the best method of caring for them?—M. E. S., Otay.

Shasta daisies are usually propagated from rootlets which come from the old stock. In fact, that is the only way to reproduce them and be sure that they come true to name. Seedlings may give some improved varieties, but more probably indifferent ones. If one wishes to experiment seeds may be had we presume from any seedsman, but the rootlets from the old plants can be bought of almost any nurseryman in the state. After setting it is but a few weeks until they begin to bloom. If reset in March or April they begin blooming so quickly that one should keep the buds pinched off for a few weeks in order to get a stocky plant which has not been weakened by over bearing of blossoms. Its requirements are very simple. An occasional hoeing with thorough irrigation is all that is necessary. If one wishes to grow the monster blooms six inches in diameter, then additional care with fertilizing is required. The plant is wonderfully satisfactory and repays any care given to it.

### Cracking Walnut Seed.

Should wild walnut seed be cracked before planting and is it too early to plant now? Is tobacco subject to frost? When should camphor be planted?—Subscriber, Hemet.

Walnut seed are usually buried in damp sand as soon as gathered in the fall and allowed to remain through the winter until spring. Then as they sprout they are taken from the sand and planted in nursery rows.

Tobacco will not stand any degree of frost.

Camphor seed may be planted in January, February and March. Plant in flats, with light covering, then when two inches high, prick off into pots. They may later be planted in the open ground. The seed should be planted while fresh as it soon looses its vitality. A pound of good, fresh seed will give you about 2000 plants.

### Milch Goats Valuable.

I noticed your reply to G. B., Nordhoff on the milk goat and for fear your statements may gain ground I must say a few words for the most valuable little goat. After several years milking many goats, I can go you lots better.

The common Spanish or Angora goat will give from two to three quarts per day and I have had several that would hold this up for six or eight months. I am milking a common Angora goat today that has given two quarts a day for the past eight months. If G. B. will send 15

**POULTRY SHOW DATES.**

**Petaluma, Dec. 8-11, 1909**—H. R. Campbell, Secretary, Petaluma.

**Los Angeles, Jan. 5-11, 1910**—Annual Meeting Poultry Breeders' Association of Southern California at Chutes Park. S. E. Salisbury, Secretary, Monrovia.

**San Diego, Jan. 11-15, 1910**—J. F. Goforth, Secretary, San Diego.

cents to U. S. Department of Agriculture, Washington, he will get the book concerning the milk goat by George Fayette Thompson, M.S.

The milk from goats is very rich with heavy cream and is far ahead of the Jersey cow and if well fed will milk nearly up to kidding. The goat is fast taking the place of the cow for family use.—C. A. Loud, San Diego.

The Bulletin referred to by Mr. Loud Bulletin No. 68 of the Bureau of Animal Industry "Information Concerning the Milch Goat."

(Continued on next Page.)

## Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Kidney Trouble.

My mule's kidneys are affected so that when I work him his urine is the color of blood and almost as thick. He has no fever, eats heartily.—W. S., Newhall.

A first principle in treating any disease is that if it irritates the mule's kidney's and bladder to get him heated up, you must not work him so hard. Give him one-half ounce of turpentine in three ounces of cotton-seed oil three times daily.—R. T. W.

### Lumpy Jaw.

I have a young heifer had a calf about the 15th of September and appears well and healthy, but has a swelling under her lower jaw which started about a month ago. I put some liniment on it which the veterinarian gave me but it did no good.—Subscriber, Gridley.

It may be only a simple abscess or it may be lumpy jaw. It is impossible to say without an examination. If you want to be on the safe side get the following: one pound of potassium iodide in one quart of water. Give one-half ounce of the solution night and morning in bran mash.—R. T. W.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

### A LITTLE HOME TALK.

"Willie?"

"Yes'm."

"Have you been in swimming?"

"No'm."

"How did your shirt get so wet?"

"I perspirated on it—honest, I did."

"What?"

"Yes'm. That's what done it. I run so fast to get away from where I would be tempted to disobey you that I got all wet with sweat."

"Willie?"

"Yes'm."

"Come here."

"Yes'm."—Judge.

### Grapes Decay.

I have a small vineyard of Tokay, Black Morocco and Cornichon grapes near Los Angeles. This is the third year from planting of rooted vines, and the crop was heavy and looked well until the first or middle of August, but did not mature satisfactorily. After the May heat the Tokays and Black Moroccos appeared to be sunburnt. Later as they ripened they rotted badly, the skin getting soft and slipping, then pulp decaying. They were amply sulphured several times, but as the rot does not show till coloring has commenced, the trouble can hardly be mildew. Vines show a rank luxuriant growth.—H. H. A., Riverside.

Your description of the manner of decay of your Tokay and Black Morocco grapes tallies exactly with their action after having passed through a spell of wet weather. Heavy dews, fog or rain will produce the effect. If they are that way with continuous dry weather, the problem is beyond me. For future help in this trouble, call on some one from the Whittier Pathological Station. For literature on viticulture, address Director Agricultural Experiment Station, Berkeley, Cal.—J. W. M.

### Walnuts in Interior Valleys.

Is the climate of El Cajon Valley, San Diego county, suitable for growing almonds and walnuts. It gets very hot in summer, temperature standing from 100 to 120 degrees in the shade. Would light frosts in winter harm? Soil is decomposed granite, very deep.—W. W., El Cajon.

You cannot raise walnuts that will pass out of the second or third class in such a climate as you describe. If they do not all sunburn on one side, they will surely have dark kernels which will spoil them for the trade. Almonds will do well in such a climate if they receive sufficient water and late frosts are not usual. Any frost which will show at all will kill the young fruit. I once lost a crop of almonds after they were from one-half inch to one inch long by a frost that had no effect on oranges just out of bloom, or the succulent shoots on the tips of the succulent branches. There was not one almond left.—J. W. M.

### Pruning Grapes.

When is the earliest period at which grape vine pruning may be safely commenced without injury to the vines? Would the middle of November be too early in the season? We usually start in the middle of December, but before all are pruned and prunings disposed of, the work of cultivaton is often retarded, so if pruning could be safely undertaken earlier, more time could be devoted to cultivation with better results than now. Is iron considered a good fertilizer for grapes to give them color and tone? If so, how can it be best applied, in what form and in what quantity?—Subscriber, Pasadena.

Do not prune your vines till the leaves are ready to drop or are fully ripe. The leaves elaborate the sap and furnish vigor and strength for the next crop of fruit. Any time after the leaves are ripe will do to prune. Late pruning has a tendency to make late blooming. The more the vines bleed, the later will the rank spring growth begin.

Iron is an important element in soils for some varieties of grapes, but we doubt if it would pay to apply it as a fertilizer. Sulphate of iron is the form in which it should be applied. Red soils are the best for grapes which require iron to give color, in the form of red oxide which is more available than any other form except the sulphate.—J. W. M.

# Household Department

## JUST LOOKIN' 'ROUND A BIT.

How do I like California? Really, I
can't say—
I'm only lookin' 'round a bit, I didn't
come to stay.
I've got a farm in Illinois, right on
the eastern line,
I raised the mortgage just last fall,
and every inch is mine.
I've struggled hard for twenty years
with weeds and blight and
snow;
Wife thinks I've done my share, I
ought to go a little slow.
I had to sweat all summer there,
then feed stock half the year,
There's lot's of liars 'round who say
its always pleasant here;
No weekly thunder storms? Indeed!
Don't let my wife know that,
She'd never start for Illinois, she'd
set her foot down flat.
And will I buy a place? I'm not a-
calculatin' to;
But I'd just like to know, you see, if
all them yarns is true;
About the winter pasture, with no
stock shed in the fields,
About the winter garden truck, and
how alfalfa yields.
What! strawberries, fresh on Christ-
mas and barley grown' high
Yes, its plain this land produces ac-
cordin's as you try.
These lemon and camellia trees—
they're quite unusual sghts,
And fuchias and geraniums live out-
doors by themselves?
My wife she keeps them fancy things
at home on window shelves.
I'm sort of stuck on olives; they're
medicine and meat,
I never heretofore have had enough
of them to eat.
The trees don't need no care?
Don't let Maria know—
Where I can take it easy is where
she wants to go.
Perhaps, although, I ought to plan to
please
And gain this sunset comfort in the
sunset of my life,
I'd like a vine and fig tree, and
roses running wild;
Them Easter lillies there has made
Maria crazy as a child;
Just now I've got a homesick spell
that Doctor Frost will cure,
You bet, next fall, we'll settle down
in California sure.

—Lillian H. Shuay.

## THE HAPPY SECRET

ONCE upon a time there lived a beautiful princess who became so unhappy in winter that as soon as the cold season came she shut herself up in her own rooms in the palace, and there stayed until summer came round again.

Her father was greatly distressed. In vain he tried by splendid balls and ice-carnivals to draw the princess back into court life. She would only sit in her own apartments and think how wretched every one must be.

Now, as she should be queen on her father's death, and he was growing an old man, the ministers were alarmed, and advised the king to get her married, as a husband might manage her better.

But the princess declared that she should marry only a man who could make the land pleasant from year's beginning to year's end.

The ministers were in despair; but the king proclaimed the decision of the princess; and as she was famed for her beauty, and was heir-apparent to a land both large and wealthy, many sultors came forward with plans.

These plans, however, were only either to take the princess away to the sultors' own warmer kingdoms, or to build in her own land magnificent palaces, enclosing gardens and forests, which should be safe from the cold of winter from year to year; and to such plans the princess would not even listen.

"I must see my own lands, and all its people, pleasant and happy," she declared.

Now, at the edge of this kingdom there lived a youth, named Ulf, who was much befriended by the fairies because of his goodness and industry; and to him ,as he tended his master's flocks, the fairy queen came and said:

"You must find the great gift for the princes."

"But what is it?" asked Ulf.

"When you find it you shall know," replied the fairy queen. "I think it is very near to the princess already. Go quickly to the city."

Upon this Ulf begged his master to give him a holiday, and set out as fast as he could through the snow.

While he was trudging through a great forest a little bird fell at his feet, half frozen by the cold.

Picking it up, he placed it in his bosom to warm it, and presently it said:

"Now I shall help you. Go down the narrow path until you reach a hermit's cottage. He who lives in that cottage has the Great Gift."

Thus speaking, the little bird flew away; and, knowing that it was a fairy bird, Ulf faithfully followed the path; and ere long he came to the cottage.

"Near by the hermit was scattering food for the birds.

"Good morning, my son," he said. "You have come for the Great Gift"; and ,saying this, he placed a small crystal heart in Ulf's hand.

"It has often been lost by neglect," he went on. "It has been chipped and scratched by carelessness; but it has still virtue enough in it to make the kingdom a lovely and a happy place to whoever carries it."

Joyfully accepting the Great Gift, Ulf thanked the giver, and set out again toward the city of the king's palace.

Soon, while he traveled, the youth became aware of a new, delightful power within him. He could see under the snow to where the roots of all plants were kept saft and warm. He saw into the hearts of trees and shrubs, and felt that they were gathering strength, and dreaming of summer whilst they slept under the snow. He could see that beneath the ice the little fishes swam, warm and merry, at the bottom of the water. And the icy air was no longer hateful to him, because he knew it swept into nooks and crannies and killed all evil things. Every snoflwake was a fairy on some good mission.

Coming out from the forest, and passing through the villages, Ulf knew in some magical fashion that those who had been idle in the abundance of summer were now constrained to work; that the wasteful were forced to be careful; and that the kind-hearted were more than ever moved to deny themselves that they might help others.

So the same cold season which killed evil insects and purified the air, killed also selfishness, and made

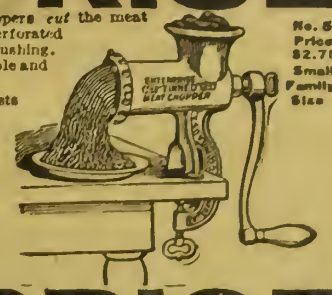
ENTERPRISE

Meat and Food Chopper

"Enterprise" Meat and Food Choppers *cut* the meat with a revolving steel knife against a perforated steel cutting plate without tearing or crushing. Easily cleaned. Practically unbreakable and will last for years.

The No. 5 "Enterprise" Chopper costs only $2.00; No. 10, shown in cut, $2.75. They are standard family size, and not only save half the work at butchering time, but are useful in the kitchen every day in the year.

Made in 45 sizes and styles for Hand, Steam and Electric Power. We also make cheaper Food Choppers, but recommend the above for the reasons given. Illustrated catalog free. Sold at Hardware and General Stores, etc.



No. 5 Price $2.75 Small Family Size

ENTERPRISE

Sausage Stuffer and Lard Press

Lessens the labor at butchering time. Two machines in one. Well made and does its work quickly and surely. Cylinder is bored true and plate fits accurately. Pressure cannot cause meat to rise above the plate. The Patented Corrugated spout prevents air from entering casing, ensuring perfect filling and preservation of sausage.

Machine can be changed into a *Lard Press* in a minute's time. Can also be used as a Fruit Press.

Your dealer will be able to supply you with the "Enterprise" Sausage Stuffer and Lard Press.

No. 25—4 quart Japanned Price $6.00 4 sizes Tinned and Japanned

ENTERPRISE

Bone, Shell and Corn Mill

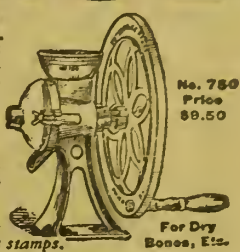
The "Enterprise" Bone, Shell and Corn Mill is a good all-round mill for farmers, poultrymen, etc. and for compactness, strength and durability is unexcelled. Handy for grinding poultry food and making bone meal fertilizer. Mill shown in cut $9.50, weight 60 lbs., grinds 1¼ bu. corn per hour. Look for the name "Enterprise" on the machine you buy.

Grind up dry bones, oyster and other shells, corn, etc., for your hens and watch results.

Other famous "Enterprise" household specialties are: Coffee Mills; Raisin Seeders; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, Etc., Etc.

Sold at Hardware and General Stores, etc.

*Write for "The Enterprising Housekeeper," a book of 200 choice recipes and kitchen helps. Sent for 4c. in stamps.*



No. 760 Price $9.50

hearts brighter, warmer, and purer than ever, and well content to lose their pleasures for a season, as the trees and plants lost their leaves.

Therefore, it seemed to Ulf that this was the very pleasantest land in all the world.

And because of his thoughts his face was so bright and noble that when he reached the palace the servants took him at once to their mistress, the princess, for they knew that he had some happy secret for her.

And when he had entered the presence of the princess and had given to her the crystal heart, she rose up from her couch with a face as bright as an angel's, and said:

"Now I know that to have a pure heart, clear as crystal, is to see as the angels see, and to see even a little as the angels see is to know that the land is always beautiful, because it is what the angels are making for God."

So Ulf and the princess, being of one heart, were married, and they lived happy ever after, because they knew the Happy Secret.—Spokesman Review.

### BLACK BEAN SOUP

Black bean soup is a dish which may be described as a full meal, because it contains all the elements necessary for a balanced ration. When this soup, made out of one pint of beans, is served to six people with an allowance of one-half an egg to each person, it provides one-sixth of all the proteins needed for the day. This is about all one would wish to take at luncheon or supper for the dinner with its meat course can be depended upon to supply most of the proteins needed. Black bean soup, therefore, should be considered not an introductory dish, but the chief part of the luncheon or supper.

Whatever question there may be about the usefulness of a fireless cooker for preparing some dishes—and the discussion runs high as to whether it is worth while to bother with it for some preparations—there can be no doubt as to its value for preparing a dish like bean soup, which requires long, slow cooking and which ought, in the interest of the housekeeper, to be prepared in some place where it will be in no danger of burning.

In preparing this soup, soak a pint of beans in water over night or an equal length of time by day. Pour off the water and pour over the beans two quarts of fresh water. Use soft water if possible for the lime and magnesia salts of hard water combine with some of the most valuable nutrients in the beans to form insoluble substances which digest with great difficulty. Cook a small onion with a little butter or drippings. Add this with two stalks of celery to the beans. Bring to the boiling point, put into the fireless cooker and leave for from eight to ten hours. Thicken with one and one-half tablespoonfuls of flour, cooked in one and one-half tablespoonfuls of butter and season with salt, cayenne pepper and a very little mustard—not more than one-fourth teaspoonful. Put into a tureen three hard-cooked eggs cut into slices and one lemon cut into very thin slices and pour the soup over them. Serve with pulled bread. Take pains to have the dessert of such a character that the family will not leave the table with the feeling that they have been served with a liquid meal.—La Follette's.

### DIVISIONS AND SUB-DIVISIONS OF COMMERCIAL CUTS OF BEEF.

Comparatively few of the American house wives are familiar with the various portions of the beef carcass. With the majority the demand of the butcher is for "a good roast," "a good beef steak," or "a boiling piece or pot roast." They take what the butcher gives them and pay the price demanded with little or no knowledge as to the comparative value of the cut purchased. All are familiar with the fact that the loin and ribs are the best part of the carcass and it is perhaps for this reason that fully 80 per cent of the demand is for cuts from the loin or ribs. This part of the carcass constitutes only about 25 per cent of the

whole, and thus the great bulk of the demand is for the smallest part of the carcass. This is the real reason why cuts from the loin and ribs cost from two to five times more than cuts from any other part of the beef. With the supply of cattle decreasing and the demand for beef increasing, the time has come when the American house wife must educate herself regarding this subject and be able to make her purchases to fit her pocketbook, and at the same time secure good edible meat containing as much, or more, nutriment than the more expensive cuts. The following simple rules should be remembered:

1. Remember first that it is in all in the cooking and preparation. A piece of beef from a cut that will cost four to ten cents per pound can be made as attractive, appetizing and nutritious as a cut from the loin that will cost from 25 to 35 cents per pound.

2. Insist upon seeing the carcass from which the meat is to be cut. See that it carries the stamp "U. S. Inspected and Passed," which is a guarantee from the government that the meat is healthy.

3. A prime piece of meat will not only carry an outside covering of fat, but all through the lean meat will be small specks of fat, giving it a marbled appearance. With a little experience anyone can tell good meat from poor.

4. In cooking beef remember that the sap or juice of the beef is one of the most important parts of the meat. It should be so cooked as to retain these juices. This is best done, in case of a steak, by searing on the outside. In broiling a steak, place close to the fire, at first turning frequently until the outside is seared brown. Then so place it that it can cook slowly until lone. Remember that rare meat does not mean raw meat. Meat cooked has a bright pink appearance. If not cooked it will have a bluish purple color. When beef is rare it is cooked in its own sap.

5. Beef should not be fried in grease. For convenience it may be cooked upon a hot frying pan or skillet. In this case use no grease and turn the steak over two or three times to sear the outside and retain the sap. Never cook beef in boiling grease.

6. In roasting beef have the oven very hot before putting it in. This will sear the outside and seal in the sap. The roast should be turned a time or two at the beginning and then lower the temperature of the oven slightly and let it roast until done to the point desired.

7. Pot roast should be parboiled and finished with very little water, and kept covered. A good plan is to first boil tender, then take off the water and finish by roasting in the oven.

8. Do not have the bone cut out of a roast. It cooks better and is sweeter with the bone left in. The bone also helps to hold the sap in the meat.

9. Disabuse your mind of the idea that it is not fashionable to place the cheaper cuts of beef on your table. The meat bills of the highest salaried chefs of the wealthiest families are much smaller than those of the average American cook.

---

Let us be of good cheer, remembering that the misfortunes hardest to bear are those which never come.—Lowell.

## HOW TO MAKE AND FRY A DOUGHNUT.

Not long ago I heard a woman say she dreaded to make doughnuts because she was never sure of getting them good, but that her family liked them so well that she had to provide them every week. I think a good many feel as she does—I know I did until my good angel, in the form of my next neighbor, gave me her rule and told me just how to proceed.

First, here is the rule—a good one; but there is more in the frying than there is in the making: Take two large eggs, one and one-half cups granulated sugar, two cups sweet milk, four teaspoonfuls of sweet cream or two of melted butter, one rounded teaspoonful of soda dissolved in three teaspoonfuls of sweet milk, two teaspoonfuls of cream of tartar, one-fourth teaspoonful of ginger, one-third of a nutmeg, grated, a pinch of salt,, and flour to make a dough as soft as can be handled without sticking. Sometimes, since learning how to follow the rule with good results, I use sour milk instead of sweet, with half the amount of cream of tartar or less, according to the acidity of the milk.

Heat the frying fat, adding a lump of sweet beef tallow to two quarts of lard. It should be as "smoking hot" as it can be and not smoke. Roll the dough about one-fourth of an inch thick, and use a cutter three inches in diameter, with an inner cutter of one and one-half inches. This gives a generous sized doughnut, and also cuts little round pancakes of sufficient size to fry, thus saving the rekneading of many diminutive circles, which makes needless work and overstiffens the dough. see that the edges of your cutter are sharp and true and that the seams are smoothly welded, else the fried cakes will be "wobbly" and ragged.

Many advocate turning cakes several times while frying. Turn them but once is my neighbor's rule, which I have adopted with satisfaction. We think if both sides of a doughnut are prematurely crusted over it is prevented from rising so light as it otherwise would. Fry the little cakes by themselves, saving time by lifting them. from the kettle with a skimmer. The children are sure to beg for these. Drain the sizzling hot doughnuts side ways as you spear them from the fat, thrusting your fork through the hole in the center. If they are to be dusted with sugar shake them about in it as soon as taken from the kettle. Avoid smearing your frying fork with sugar, however, else it will result in the formation of black excrescences, pleasant neither to taste nor sight, on the next lot of doughnuts fried.—Farm World.

## THE VIRTUES OF BUTTERMILK.

The virtues of buttermilk are claimed to be manifold. Among other advantages, it posseses a large share of the acid which destroys the incrustations which form on the arteries, cartilages and valves of the heart, and it is asserted that a constant use of it would free the system from troubles which inevitably cause death between the 75th and 100th years of man's life. It may be used freely and to good advantage by every one. Another point in its favor: Churning the first process of digestion, is gone through with, making it one of the easiest and quickest of all things to digest. It makes gastric juice and contains properties which readily assimilate with the digestive organs. Prevents indigestion, foul stomach, headaches, aids action of healthy bowels and saves doctor bills.

# POTASH

produces an abundance of the best quality of

## FRUITS

It strengthens the woody growth of the stock, and gives to the crop a size, color and flavor impossible to get without it. POTASH brings young stock into *earlier* bearing and adds to life of trees *in* bearing.

**Potash Pays** Make your commercial fertilizer read 2% Nitrogen, 8% Phosphoric Acid and 10% POTASH. If you apply barnyard manure, broadcast—150 lbs. Muriate or Sulfate of POTASH to the acre in addition.

Every 2 pounds of Sulfate or Muriate of POTASH added to 100 pounds of fertilizer increases the POTASH total by 1%.

### CLASSIFICATION OF PUBLIC LANDS.

THE necessity for classifying the public lands is not a recent discovery. The earliest land legislation in this country both contemplated differences in the quality and character of the public lands and planned for descriptions based on field examination. Yet even the honest administration of the land laws has ever been subject to criticism arising from the fact that no adequate provision was made for land classification.

A period of national awakening to the worth of the public domain followed the close of the civil war and another epoch of realization by the nation of the true source of its wealth and prosperity has just opened, while both the legislative and executive branches of the Federal Government are awake to the fact that exact knowledge is essential to the proper utilization of our country's great resource of land. The earlier propaganda bore fruit in the creation of a scientific bureau among whose functions was the classification of the public land, but this specific duty was subordinated to the more general task of determining the natural resources of the public domain. The duty of classifying the remaining unentered public lands is now definitely accepted by the United States Geological Survey and the opportunity earlier neglected has for several years been vigorously improved. The Survey is heartily co-operating with the General Land Office to the end that the best disposition of the land may be secured, and it should be noted that no small part of the data utilized in this work represents the fruitage of the Survey's earlier general investigations.

Utilization is the keynote of the present public land policy and by utilization I mean not that kind of local development that is promoted by the "land skinner," but rather a development whose plan weighs national needs and calculates future demands and whose accomplishment will serve our country's development in the next century as well as in the present decade. Utilization is opposed to both non-use and waste.

A notable example of land classification in aid of proposed legislation is afforded by the acts of March and October, 1888, wherein Congress directed that an irrigation survey should be made by the Geological Survey and that the reservoir sites and irrigable lands designated as a result should be reserved pending further legislation. The legislation of 1888 was itself the logical outcome of Major Powell's 1879 report on the arid lands and his subsequent work as Director of the Geological Survey and the law that eventually resulted from the work thus authorized in 1888 was the Reclamation Act of 1902, through the operation of which the West is coming into its own as the garden of the nation.

Hydrographic and topographic surveys which are now in progress under instructions of the Secretary of the Interior have as their purpose the collection of information that may be presented to Congress in aid of legislation looking toward the best utilization of the water powers on the public domain. Reports on the mineral or non-mineral character of coal, oil, and phosphate lands of which the Survey has made actual field examinations are now being transmitted to the General Land Office. Another line of activity is the segregation of non-irrigable lands under the terms of the 'enlarged homestead act" of the present year. The existence of survey data whereby within the few months since the passage of this law the Secretary of the Interior has been able to designate 162 million acres is in itself a forceful argument for an adequate land classification.

The classification and valuation of coal land is a special phase of public land work to which the Geological Survey is giving increased attention. The geologic investigations of the last three field seasons have not only furnished a knowledge of the quantity and quality of the coal on the public domain but have rendered possible the present policy of obtaining coal prices for coal lands. The General Land Office now depends on the Geological Survey to furnish detailed valuations for every 40-acre tract of coal land that is placed on the market. In the two and a half months following the adoption of the revised scheme of valuation the reports to the General Land Office released to agricultural entry approximately two and a half million acres in Colorado, Wyoming and Montana and placed selling prices on nearly 400,000 acres of coal land with an aggregate valuation of over $15,000,000. The price of Government coal land is now determined on the basis of estimated tonnage, the unit rate varying with the quality of the coal from ½ cent to 3 cents a ton for coal deposits within 15 miles of a railroad. These prices average less than one tenth the usual royalty paid in the West. Yet this conservative valuation will more than double the average price of public coal lands. In exceptional cases the price based on tonnage represents a fifteen-fold increase over the old minimum price. It is conceded that this policy of basing the price on the quantity and quality of the article sold will not encourage purchase by speculators, but I maintain that the Government valuation will not impede the disposition of the coal deposits for purposes of utilization. The real development of the West will be promoted, not retarded. The increased valuation of the millions of acres of public coal land must result in increased contributions to the Reclamation Fund and greater possibilities for local utilization of the agricultural lands through irrigation.

A principle that is winning increased recognition in land legislation is that of relative worth. The present coal land law expresses this principle by giving gold, silver and copper deposits priority over the coal and the coal in turn preference over agricultural values. These distinctions necessitate land classification based on adequate field examination. Wherever the different values can be separated that separation by appropriate legislation is at once the eas

test and best solution of the problem, and the first step in this direction was taken in March of this year in the passage of the Mondell Act whereby the homeseeker may secure all for which he makes entry—all that he swears he is getting—while the coal beneath his tillable lands is reserved to the nation for future disposal.

The ideal land classification is that based on field examination, scientific and detailed enough to include every natural resource; the ideal land legislation is that which fully recognizes the principle of relative worth; and the ideal land administration is that which will assure the reservation or the disposition of the land for its highest use.—Geo. Otis Smith at Irrigation Congress.

### FARMING FOR WOMEN.

Almost a million women in the United States are either farmers or farm laborers. Thanks to the growing popularity of the homestead in the far West and to a belated appreciation all over the country of agriculture as a field for woman's industry this number is rapidly increasing. The United States, however, has not gone so far in this respect as England, where in the dairy sections women have entire control of the herds; or France, where nearly 3,000,000 women are engaged in farm work; or most of the countries of continental Europe, where the finer breeds of cattle are mainly the result of woman's efforts.

The 1900 census showed 456,405 women in the United States working as farm laborers and 307,706 women farmers. The 1910 census will undoubtedly show this number materially increased, while if the plans of philanthropic economists in Massachusetts are successfully carried out that state alone will add 100,000 to the aggregate. The Woman's Massachusetts Homestead Association is planning to provide suburban homes for the 100,000 dependent spinsters and widows which that state acknowledges possessing, the plan being to have the commonwealth buy tracts of land wherever available, divide them into acre lots and then through a commission supply the women with a share of land. If the state is not willing to furnish the land free, the association asks that it take a mortgage on the land bought by philanthropists, develop it, build cheap and comfortable homes on it and furnish the necessary implements to cultivate the soil. By this means, it is contended thousands of women and children will be taken out of the large cities, congested slum districts will be released and the women and those dependent on them will be placed where they can be profitably employed under sanitary conditions.

All over the country women are making a decided success of farming. Some are employers of labor, simply managing their properties, while others are farm laborers, doing their share of whatever work is to be done. Notable among the latter class is a New Hampshire woman who wears men's overalls and jumpers for convenience and can do a man's work at practically everything except holding the plow. In regard to adopting men's apparel she says:

I discovered the greater convenience of men's clothes quite by accident and at once I decided to wear them when doing any kind of outside work on my place. I was storing hay in the barn with skirts on one day last summer and found I could not avoid treading on them and getting thrown. I hit upon the idea of wearing overalls and had no more trouble after that in handling a load of hay. I have continued to wear men's clothes since on the farm. People laugh at me, I know, for this and for driving into town with a load of farm produce or wood, but I don't care. My work is honorable and I believe in dressing the way most convenient for me.

A Missouri woman who is making a great success of farming brings up another point. She is an employer of labor rather than a laborer and has learned that the ordinry farmhand does not care very much about being bossed by a woman, even if she is a skilled farmer. She says:

"Above everything else, women must be considerate of their employes. Men don't like to be bossed by a woman and I don't blame them, but I try to employ help that needs no boss and try to have them realize that much is depending on them, consequently we never have any trouble and my men try very hard to do things for my interest. They help me and I help them. When I can do anything to help them out of a close place I always do it. I have never spoken a cross word to any employe."

Many problems confront the woman farmer, but it is to the everlasting credit of the sex that she is solving each and every one as it arises. Her tact and good, common sense are factors which are helping toward her success, while her ability to make a dollar go about five times as far as a man can make it go is adding to her financial profit. Records show that women farmers are quicker than men farmers to adopt new machinery and new inventions. As a rule they are planting pedigreed seed and reaping good harvests.

### SMUT TREATMENT.

"We take the cleanest, best seed obtainable and put it through a good fanning mill once or twice till all of the 'smut balls' are blown out and all of the small grains sifted out, when it is ready for the vitriol water, which is prepared as follows: Fill a 50-gallon barrel two-thirds full of cold water. Next dissolve 15 pounds of blue vitriol in a wooden bucket by pouring boiling water on it and stirring it for 10 or 15 minutes. Pour the water off in the barrel and fill the bucket again. This is repeated until the vitriol is all dissolved. If the barrel is not full, finish filling with cold water and stir slightly to thoroughly mix the solution. We then pour six bushels of the clean wheat on the floor, and sprinkle three gallons of the vitriol over it, using a small can with holes in the bottom for a sprinkler. While the water is being applied, the wheat is shoveled continually from side to side, simply turning the pile over till it is thoroughly wet and thoroughly mixed, when it is sacked and allowed to dry for 24 hours. It is then ready for the drill. The floor where the vitrioling is done, the sacks and the drill should be thoroughly cleaned and sealed before using."

### SPARE THE ROD.

The Fulton Sun gives this as the result of interviewing thirty business men and thirty loafers: "The thirty business men had all been flogged freely by their parents when they were boys, while out of the thirty loafers twenty-seven had been 'Mamma's darling,' and the other three had been raised by their grandmothers."

# A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—"The Locomotive Base"—"The Automatic Spacer"—"The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."

## Yours for 17 Cents a Day!

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

## A Quarter of a Million People are Making Money With

The OLIVER Typewriter

### The Standard Visible Writer

The Oliver Typewriter is a money-maker, right from the word "go!". So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

**"An Oliver Typewriter in Every Home!"**

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

Hops 1909 crop .....19@23
Hops 1908 crop .....15@18
Old .....10@13

### Honey.

White comb .....14@15
Light Amber .....10@12
Extracted W W .....7½
Extracted light amber .....6½@7
Beeswax per lb. .....25@29

### Hay.

Scott, Magner and Miller say:—Arrivals of hay for the past week have been 3183 tons, as against 2806 tons for the preceding week. Cars are now becoming more plentiful, and we are informed by the Railroad Co. that there will be no further shortage from now on.

The demand for hay for the past week has been very light, receipts being double what there has been any demand for. Naturally, prices have weakened, and there has been a decided decline on all grades and qualities of hay during the week just ended.

The alfalfa market is unchanged; a few cars consigned. Interior hay being sold at our lowest quotation.

Straw is in light supply and shows no improvement in price.

This week's quotations are:
Choice wheat hay.....17.50@18.50
No. 1 wheat or wheat & oat 15.50@16.50
No. 2 Wheat or wheat and oat .....13.00@14.00
Choice tame oat .....15.00@16.50
Other tame oats .....12.00@14.00
New Crop wild .....9.00@13.00
Stock hay .....7.00@8.00
Alfalfa .....9.00@12.00
Straw .....55@65

### Grain.

Wheat No. 1 .....1.90@1.97½
Barley No. 1 .....1.40@1.47½
Oats white .....1.60@1.65
Oats gray .....1.60@1.65
Rye new crop .....1.85@2.00
Cal sm round corn .....1.75@1.80
Alfalfa seed .....16@18
Mustard brown .....3¾@4½
Millet .....2¼@3
Flaxseed .....4
Broom corn seed per ton .....23.50

### Feed Stuff.

Bran per ton .....29.00@30.00
Feed cornmeal per ton ....37.00@38.00
Cracked corn per ton ....38.00@39.00

Rolled oats per ton .....33.50@35.00
Oil cake per ton .....38.50@40.00
Cocoanut cake per ton .....25.00
Middlings .....36.00@37.50
Mixed feed per ton .....28.00@33.00
Shorts .....31.50@33.00

## Citrus Market

LOS ANGELES, Dec. 1, 1909.

The market is somewhat better than reported last week but still suffering somewhat from the effect of green fruit. It seems plain that a mistake has been made in forwarding some shipments altogether too early. This fruit has gone but little into the auction markets, but scattered over the country in the general markets.

Lemons are exceptionally strong in tone and the few coming from the Mediterranean are not sufficient to depress the market at all. All fruit going forward is of exceptionally fine quality.

**Shipments.**

Shipments from Southern California points to date since November 1st; 427 cars of citrus fruits of which 194 were oranges and 233 were lemons. To same date last season; 420 cars of which 88 were oranges and 332 lemons.

From Central and Northern California total shipments of oranges for the season since November 1st are 1022 cars.

---

NEW YORK, Nov. 26.—Four cars Valencias and two cars lemons sold. Market strong and higher on Valencias, fairly steady on lemons. Weather clear and mild.

## THE MANLY MAN.

"What shall the young man be like? My first qualification for him is manliness. Even the girls who go into raptures over womanhood, hate feminine men. He must be a man in every sense. This means that he must have led a man's life. The pity is that there are young men who want certain girls to love them, who have never taken their places in the world's battle as men.

"The young men who have only known a boy's life are not fit to marry. They need experience and testing; they need the maturity, whatever their years, that will make them safe and good husbands. This means also that they must be unpampered and unpampering. Young men whose parents have foolishly waited on them are unfit to marry, because they will never grant in practice the equality of husband and wife which the marriage contract implies. However pleasant it may be for a doll, or poodle dog, no woman wants to be made the home pet. There are men who subtly show their so-called superiority by never letting the wife go out of sight, who think that their presence is all the good woman desires.

"It is required that he who would be a good husband must be good in other relations. He must be a good son, a good brother; in his industrial relations he must be an honest and good worker. There is no such thing to me as departmental ethics. The young man you would not trust in business, with whom you would not trust your money, you dare not trust at your hearth.

## CROP VALUES OF CALIFORNIA.

Investigations that have been made into the yields of various crops in California by The California Promotion Committee give insight into the vast importance of those industries to which little consideration is generally given. According to the calculations of The Committee the total industrial output of the State for the year 1908 amounted to $1,005,000,000. Of this vast total agriculture played a very important part, its production amounting to more than $400,000,000. This ouput is just double that of three years ago.

Fifteen years ago wheat was about the only grain grown, and at that time it was the mainstay of agriculture. The average annual production of wheat then was valued at about $40,000,000, with other grains comparatively without computative value. In 1908 wheat value had fallen to about $19,000,000 while barley had increased to $26,841,394, raised on land valued at more than $50,000,000. Rye, which increases annually in output, was valued at $228,000, making a total output value of these two grains of more than $27,000,000, which was more than the combined values of all other cereal products of the State.

Hops, also, which is a growing industry, makes a heavy output on an invested capital of about $7,000,000.

More than half of the grape vines growing in the United States are in California, with an annual output value of more than $25,000,000 and for the production of which there is an invested capital of more than one hundred million dollars.

## ONE THOUSAND SUCCESSFUL MEN.

I have on my desk a list of 1000 successful men of this nation. By "successful" I do not mean mere money-makers, but men who have given us new conceptions of steam, electricity, art, etc. These are the men who influence our moral as well as physical lives. They construct for better things.

How these men started in work is interesting. Their first foothold in work is a fine study.

Three hundred started as farmers' sons.

Two hundred started as messenger boys.

Two hundred were newsboys.

One hundred were printers' apprentices.

One hundred were apprenticed in manufactories.

Fifty began at the bottom of railway work.

Fifty—only 50—had wealthy parents to give them a start.—Juvenile Court Record.

## SELF-PRESERVATION.

Mr. Brown and his family were standing in front of the lion cage.

"John," said Mrs. Brown, "if those animals were to escape, whom would you save first, me or the children?"

"Me," answered John without hesitation.—Everybody's Magazine.

## CASE FOR A DESPERATE REMEDY

The Proud Mother—This boy do grow more like 'is father every day.

The Nenghbor—Do 'e, poor dear? And 'ave you tried everything?

# Business Notes

### GOOD TOOLS.

Next to the proper understanding of the tree or vine the principal requirement in shaping it for bearing its greatest load is proper pruning tools. It is true that a good workman can work with poor tools but it is also true that far better and more economical work can be done with tools that are sharp and adapted to their use.

Every fruit grower will appreciate the advantages of a pruning shear that has a double cutting edge, as nearly all the pruning shears heretofore on the market have had only one cutting edge and the other edge, being dull, would bruise and peel the bark from the limb and injure it so it would not heal up smoothly; but we are told the pruning shears manufactured by Rhodes Mfg. Co., Grand Rapids, Mich., whose ad appears in this issue, have this double cutting edge which cuts from both sides of the limb, does not bruise the bark and leaves a clean smooth cut which heals quickly.

This company prepays express charges to all parts of the United States. Their little folder gives full particulars of the different types of shears, which will be interesting reading for every fruit grower.

### PRACTICAL EDUCATION

A general education is desirable; a polite education a luxury; but a practical, every-day, money earning business education is almost a necessity in these days when business principles are supreme in the great work of life. Regardless of the occupation you expect your children to follow, you should see that each one of them has a practical money-earning education. They should know how to transact business carefully and systematically; and how to keep books giving an accurate record of these transactions; they should know how to arrange and compose convincing business letters.

The San Francisco Business College, 908 Market street, San Francisco, is one of the best schools in America in which to secure this education. It is considered along practical lines by men of business experience. It is located in the center of business activity where its students and faculty may come into closest touch with business men and business methods. It is equipped with office furniture of the best pattern.

### TO BE HAD FOR ASKING.

The Sixth Annual Catalogue of the Coulson Poultry & Stock Food Company has been issued and it should prove most valuable to anyone endeavoring to make a profit from the poultry business. Of course the principal feature of the catalogue is the description of the Coulson foods, but condition powders, meat, sea-shells, lice killers and disinfectants together with various remedies make a valuable feature of the forty page booklet. Besides there are a number of pages given to hints and suggestions on poultry raising. If the Cultivator is mentioned a postal card will secure it and would advise poultry raisers to write for it at once.

The December Century is a magazine of promise and fulfilment—promise of notable artistic and literary features in the first paper of "The Holy Land" series by Robert Hichens and Jules Guerin, in the beginning of Helena Modjeska's Memoirs, and in the second instalment of May Sinclair's "The Creators: A Comedy"—in color reproductions of Guerin's marvelous paintings of "The Temple of Bacchus, Baalbec," and "The Columns of the Sun, Baalbec," and of two notable paintings by American artists, Mrs. J. Francis Murphy's "Eleanor" and Ernest L. Blumenschein's portrait of Mr. and Mrs. Ellis Parker Butler and child.

We have been informed that the post office of the Oregon Nursery Company at Orenco Oregon, has been duly installed and that all remittances by post office money order should be made on the Orenco Post Office. Any of our readers desiring to address this company should bear this in mind.

### SAME, BUT DIFFERENT.

Most lawyers take a keen delight in trying to confuse medical experts in the witness box in murder trials, and often they get paid back in their own coin. A case is recalled where the lawyer, after exercising all his tangling tactics without effect, looked quizzically at the doctor who was testifying and said:

"You will admit that doctors sometimes make mistakes, won't you?"

"Oh, yes, the same as lawyers," was the cool reply.

"And doctors' mistakes are buried six feet under ground," was the lawyer's triumphant reply.

"Yes," he replied, "and the lawyers' mistakes often swing in the air."—Philadelphia Ledger.

### UNPREJUDICED.

Mike McGinnis was being examined for jury duty in a murder trial.

"Mr. McGinnis," asked the judge, "have you formed or expressed an opinion as to the guilt or innocence of the prisoner at the bar?"

"No sir," replied Mike.

'Have you any conscientious scruples against capital punishment?"

"Not in this case, your honor," Mike replied.—Success.

### DANGER.

Tommy—Pop, what is meant by the mother tongue?

Tommy's Pop—Sh-h-, my boy! Don't get her started.—Philadelphia Record

"Would you," he asked, "care to live to be a hundred years old?"

"Not if anybody knew it,' she replied.

# The Smooth Running Pomona Deep Well Pump

**RELIABILITY**

Has passed through another most successful season's run, this being the fifth since starting.

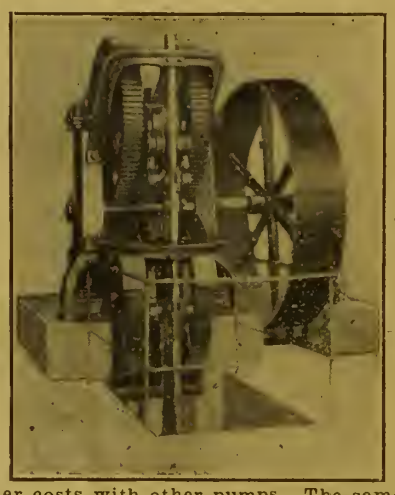
There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work we know and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

**ECONOMY**

May be driven by a steam engine, gas engine or electric motor, and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbitted and will last a lifetime with the smallest outlay for repairs.



We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make engine being used in both cases.

# Poultry Industry Great Commercial Factor in California

## Valuable Artisles Written by Many People in Many Parts of the State and Representing Many Breeds

WITH CALIFORNIA importing from the Middle West hundreds of carloads of eggs and poultry products, there is need for an awakening to the necessities of this state for saving the vast sums which are sent over the mountains in payment for these shipments. The same is true of practically all livestock products. California is importing bacon, lard and all pork products as well as beef and even some mutton, but the importations of poultry are greater than of any other livestock products. In many particulars no section of the Middle West is so well fitted to succeed in this industry as is our own state. To be sure the cry always goes up here that "Feed is high." This is true, but when favorable climatic conditions are considered, it seems that they should offset Middle West feed prices. In addition they have to contend with the two thousand or more miles of transportation which is expensive and trying on condition of shipments.

On the other hand, in this state many people go into the industry expecting easy money, not appreciating the fact that it requires a thorough understanding of its principles and a willingness to work out its details. Such people soon find failure staring them in the face, and it is possible there are more quitters in the poultry industry than in any other in California. The Cultivator would not say anything to cause people to enter into poultry raising without properly considering its drawbacks and the work required, and to the end that we may give an intelligible idea of the industry and the how of success, we have sent out a number of questions to several poultry breeders. So far as possible we have sent to different parts of the state and amongst breeders of different varieties. Many have responded, though some have not, which accounts for one or two of the favorite breeds not being represented in the replies. We believe these answers will give a better view of conditions and methods of handling poultry than any series of set articles. Besides they follow out a line which has been taken up by the Cultivator with citrus and deciduous fruits ond other agricultural industries of the state. Further, we hope that these communications will cause others to give of their experience in the columns of the Cultivator, thus affording the most valuable literature we can gather together regarding the industry.

The questions sent to the various poultrymen are as follows:

"Having given special attention in the Cultivator from time to time to various features of California farm methods, we have found these special efforts fully appreciated and of great value to the particular interests touched upon. The poultry industry has been represented in these specials and its importance calls for repetition of that special effort, or rather than a repetition, perhaps an improvement in our former poultry specials, in this, that we wish a more extended representation of breeds and of localities. To this end, we send the following questions and will appreciate such answers as you may deem proper:

1. Do you produce poultry and eggs for market and are you breeding to build up a strain of pure bred stock?
2. How many do you keep?
3. What is your breed and why do you prefer it?
4. Can you give cost of feed per hen per year; also net protfit per head?
5. What do you feed? Do you buy in large quantities or as needed?
6. What do you grow for green feed?
7. Do you yard your fowls or give range?
8. Do you use open front, movable or closed houses?
9. How do you handle the lice and mite problem?
10. Can any co-operative method of disposing of products be used so as to give a more just proportion of profit to producers, and what plan would you suggest?
11. On the whole do you consider that for the labor and capital invested, the poultry industry is profitable and has a greater future in this state?

Replies received follow without comment:

### S. E. Gregg, Excelsior White Leghorn Ranch, Riverside.

1. I do produce eggs for market but as few fowls as possible, these being confined to surplus cockerels sold as broilers and fryers. I have never found it necessary to send hens to the butcher. I certainly do breed pure bred stock.

2. One thousand laying hens.

3. S. C. White Leghorns exclusively. I prefer them after trying White Rocks, Buff Orpingtons and Black Minorcas because of their smaller consumption of food, superior laying capacity as well as their hardiness and adaptibility to California climatic conditions.

4. During the past year of abnormally high prices it has cost me one dollar and fifty-five cents per hen to feed them. And now you come very near prying into private business and ask a question which you would never think of asking the butcher, the baker or the candlestick maker. If I were to ask you how much you made per year publishing the "Cultivator" you would tell me that it was none of my business and tell the truth too, and if I should tell you the same regarding my profits it would also be true—but the poultryman seems to be in a class by himself in that everyone feels free to ask all sorts of questions. I have been asked, since I have been raising chickens, How old I am. How long I have been married and do my wife and I live happily together. How many children I have. How old are they. What I do for pip. How much money I put into this business. Do I wash my hens to keep them so white, are any of my daughters married, are they engaged, and always how much I make out of this business. I do not know why it is that the "chicken man" should be expected to give away all the secrets of his business to entire strangers but so it is, and so I will tell you, in strict confidence of course, that my net profit last year was almost exactly twice as many dollars as I had hens.

5. I feed a dry mash composed of bran, ground barley, middlings, corn meal, beef and blood meal and a small proportion of one of the proprietary egg foods. This is fed in hoppers and kept before them all the time. At night I feed wheat, whole barley or Kaffir corn all they will clean up, which I find is about three quarts to fifty hens. I buy as needed.

6. Alfalfa to which they have free access.

7. My fowls are yarded. I get all the free range I want from my neighbors' hens.

8. My houses are stationary and can be closed but when all windows are open they are about one-half open sided.

9. For lice I dust the hens individually about twice each year with an insect powder composed of flowers of sulphur, tobacco dust, flake napthaline and fine road dust. The rest of the work of keeping the lice down the hens do themselves. I have no mites at all. I keep them out by spraying the houses, perches, nests, etc., twice a year with creolium, one part creolium to twenty of water. When I say I have not mites I mean just what I say, I have none and have not had since I commenced the Creolium treatment three years ago. P. S. I am not interested in the sale of Creolium.

10. This number I will pass up to those who know more than I do. It is a hard problem—too many for me.

11. The average result of poultry raising is failure. The average flock of hens do not lay enough eggs to pay their feed bill and the labor of caring for them. This is not joke but cold, disagreeable fact. It is also true that the average merchant makes no money, that not one newspaper venture in five is a paying proposition and that the same can be said of almost any other line of business. Poultry raising is no job for an imbecile or a lazy man, but given the same amount of horse sense, energy and push that is necessary to make any other business a success good returns can be had from poultry raising. When the poultry men will stop haphazard breeding or breeding for "points" without reference to egg production and breed from the best only, when he will use the same care in the selection of his breeding stock from a utility standpoint that the successful dairyman, for instance, uses, there will be a far greater future for our business than the past has ever shown. In my opinion there is just one way to find out what hens are fit to breed from and that is the trap-nest. I have very little confidence in feeling under a hen's tail to tell how many eggs she is going to lay, but that is another question.

* * *

### Vincent G. Huntly, Petaluma.

1. I market eggs when not sold for hatching purposes, and am endeavoring to build up the best of strains in several varieties of pure bred stock.

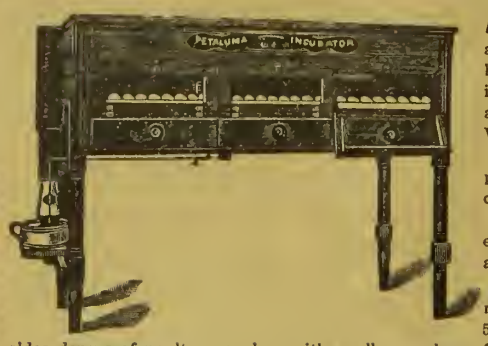
2. Keep in the neighborhood of 900 to 1000.

3. My principal breeds are Black Orpingtons, Buff Orpingtons, Barred and White Rocks, Black Minorcas, Buff and White Leghorns, White Wyandottes, Indian Game, and last but not least, Aylesbury Ducks.

4. Cost of feed varies according to market and breed of poultry kept. White Leghorns or the like should run from $1.25 to $1.50 net profit per year, according to their vigor and laying capacity. To a certain extent what you put in a hen, if she is a good one, you have a chance of getting out of her.

# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

SPECIALTY BREEDER of

## Wyckoff S. C. White Leghorns

**"THE BUSINESS HEN"**

When it comes to egg production, it would be extremely difficult—probably impossible—to find a more satisfactory breed than the White Leghorn.

In choosing the foundation for a money-making flock of White Leghorns, you will make no mistake of you adopt the famous Wyckoff strain, which has stood at the head of the heavy laying class for upwards of a quarter of a century..

Our breeding pens include a splendid collection of high-class stock—hens of proven merit as egg producers, carefully seleetd from our heaviest layers, and properly mated to insure best results in the development of the ideal White Leghorn of the genuine laying type.

EGGS FOR HATCHING, $2.50 per setting (15); incubator lots, $8.00 per 100, or $7.50 per 100 in shipments of 200 or over.

RANCHO MIRASOL

## WHITE LEGHORNS

***25 Firsts, Silver Cup, and Two Silver Medals***

already won at five shows this season. Sacramento, A. Y. P. Exposition, Seattle, Phoenix, San Jose and Oakland. Eggs by the setting or in incubator lots. A few good breeding cockerels and trios of ducks.

***Goodacre Bros.*** ***Compton, California***

5. My feed is varied from time to time but general ration is: Morning mash consisting of 3 parts bran (heavy), 1 middlings, 1 shorts, 1 ground corn, 1 rolled barley, 1 Darling's meat scraps, small quantity linseed meal, charcoal, bone meal, sulphur, salt and pepper at times; grain (early morning sparingly); evening, grain, Chevalier barley or oats, cracked corn; afternoon, kale, etc., ad lib.

6. For green feed grow kale, alfalfa and Swiss chard.

7. Yard fowls, but arrange alternately, that is, we have open runs for four or five pens at a time.

8. All kinds of houses are used for the purpose of experiment, each presenting advantages and drawbacks. The open front, properly constructed, seems in favor.

9. Handle lice and mites in various ways. For hard cases spray houses with corrosive sublimate solution twice at intervals of three days. Then follow with crude oil and carbolic, the latter ten per cent, in a week or so.

10. Co-operation is the only way to the best results for the producer, but unfortunately it is difficult to get farmers generally to co-operate, owing to their love of independence.

11. The poultry industry promises a great future, and is profitable to the extent of a fair living, but is not a "get rich quick" business as a general rule.

* * *

S. C. R. I. RED BRED AND OWNED BY DR. C. E. WINSLOW, MONROVIA
Won First as Cockerel, Southern Cali fornia Show 1908. First Prize as Cock, 1909.

**Frank E. Baldwin, San Jose.**

We are engaged in producing eggs and poultry for market and breeding to produce Standard bred Single Comb White Leghorns, equal if not superior to any in the world. We keep 1500 matured fowls and from 1000 to 2000 youngsters coming along—have over 1000 chicks growing now.

We prefer the White Leghorn because the climate of California is peculiarly well adapted to the successful breeding of this variety. We have a climate superior to Southern Italy where the Leghorns were famous egg producers before this country was discovered. Because the White Leghorn has been bred to a larger size than any other Leghorn without losing its egg producing qualities. Because its larger size gives a larger egg. Because the young roosters come to one and one-fourth and one and one-half pounds plump broilers in less time and with less feed than any other variety. Because there is more money in the quick return from marketing small broilers than keeping heavy breeds to fryer and roaster ages. Because the fertility of White Leghorn eggs is good (as compared with other varieties) all the year around, thereby enabling one to hatch at such time as will bring his broilers into market when prices are highest. Because of the activity of the males fewer are required in a flock, making the feed bill less for the matings than in the heavier breeds. Because the White Leghorn female produces the largest egg (as well as a greater number), for the feed consumed than any other fowl. Because the white feathers and yellow legs make a neater looking broiler than any black or colored bird. Because the White Leghorn is hardy and easy to raise, (from carefully kept records we find that we raise 95 per cent of the chicks put in our brooders), and more people succeed with this variety than with any other. Because the White Leghorn lays a white egg commanding a better price in our markets than a colored egg. Because the White Leghorn is one of the oldest varieties and breeds true to color and type where one begins with a good strain. Our birds net us a little over two dollars a year above the cost of feed.

The cost of feeding is about a dollar and a half per year per hen. We figure the profit from our hens on a market basis at about $1.25 each above feed and the balance of the $2.00 or over comes from the fancy. We began our poultry keeping exclusively for market eggs. We found it cost no more to keep a thoroughbred than a scrub and paid better. Then we found it cost no more to keep the best strain of Standard bred fowls and it paid still better. The reason Standard bred fowls pay best is because they are larger, stronger and better producers. No

ordinary flock can produce for market, broilers, fryers or roasters, in the same time or with the same feed that the same weight in meat can be produced from Standard bred poultry. The same is true in egg production.

We feed wheat once a day, green stuff once, dry mash before the fowls all the time and an occasional wet mash by way of variety. The mash is made up of bran, ground barley, middlings, corn meal (in rainy season), alfalfa, meat scrap, and cocoa nut meal with a little salt. We buy in large quantities as room to store permits.

We grow for green stuff: barley, Swiss chard, kale and mangle wurzel beets. With plenty of water we find swiss chard very desirable, but mangle wurzel beets the most satisfactory with little water at command.

We give range to the growing stock from time they leave brooders till maturity and then yard them. They need the range for growth and development but better results can be obtained from yarded fowls after maturity if properly cared for. We have two yards to each house (10 hens) in one of which barley is growing. When six or eight inches high we use that yard for the hens to run in and immediately plow and sow to barley the other yard. By repeating this operation the fowls are provided with fresh ground from which the growing barley has taken all disease germs as well as having a constant supply of green feed.

We use open front, stationary houses facing the east (our rains are from the south and southwest and winds from the northwest) and only one thickness of burlap opposite the birds on the roost is needed in the rainy season where the front roost is only two feet from the front of the house. The houses have movable dropping boards, oil can nests below and scratching pen below nests, the latter being reached from rear of house. Everything is movable and once in a year or two we spray everything with a ten per cent solution of crude carbolic acid in number 28 distillate. The roosts are hung from roof by wire and sprayed with a hand "Prize" spray pump with a Bordeaux sprayer worked from a pail every two or three months—the nests are sprayed at same time. This solves the mite question. The body lice are kept within healthy limits by providing dry dirt in the rainy season in the houses under the dropping boards, one-third of the ground floor of the houses being devoted to this dust bath. In the dry season water is regularly turned on the ground to moisten up the earth around a tree for instance, so the birds can work holes in the ground and dust themselves when the regular planting and growing of the barley in the alternate yards is insufficient. If these simple ideas are followed no one need give the lice or mite problem a second thought or a moment's worry.

We have found, for the labor and capital involved, the poultry business pays better than any other business we know of which is not specially favored by enjoying a monopoly or advantage not open to others. The poultry business, as a whole, is in its infancy. On this coast it is far behind the market requirements owing to the rapid increase in our population and the few new comers who need to interest themselves in poultry as compared with the many well to do people who come to enjoy the outdoor life in this wonderful climate. These conditions will continue for a long time and the best informed poultry men are increasing their plants and stocks to take advantage of conditions. The get-discouraged-too-quick people went out as wheat and feed stuffs went up, and were surprised to find poultry and eggs more than enough higher to make the difference. All that the established poultrymen can produce and all that the new people can add to the output will not supply the home demand on this coast for years to come. The poultry industry has a bright future and will compare favorably with any industry on this coast for returns for capital, labor and knowledge.

* * *

**W. L. Sullivan, Agnews.**

1. We breed for show and breeding stock. Our strain is ten years old.

2. We hatch about 800 and have others reared for us.

3. Our breed is S. C. B. Orpingtons. Never had a breed that would make so much money.

4. We have too many chicks coming and going to be able to give an exact average cost of feed per hen per year, but it costs about $1.25 to mature one of ours our way.

5. I give the formula for feed we use:

10 lbs. Bran
10 lbs. Middlings
3 lbs. Alfalfa meal
4 oz. Charcoal
3 lbs. Meat Meal.
2 oz. Salt

This is to be kept in a "hopper" before the birds at all times. At evening I feed grain in litter—wheat, Egyptian corn, etc. Green food ad. lib. We stock up with wheat at threshing time.

6. Grow Swiss chard for green feed.

7. We both yard fowls and give range.

8. Use open front houses with burlap curtains.

9. Use dust powder for lice and coal oil for mites.

10. Just at present concentrate consignments. Get the least dishonest commission man and try him out with the bulk or all of the produce of the neighborhood.

11. This "hen business' hasn't started yet. Do you know that less than one-tenth of one per cent of the farmers of this country keep pure blooded fowls?

* * *

**A. W. Huskins, 713 Waterloo St., Los Angeles.**

I am breeding for both pleasure and profit and I aim to produce as near the Standard of perfection as possible. By breeding from only the vigorous and best shaped birds I produce the best layers and market poultry. During the breeding season I try to keep about forty breeders, twenty White Wyandottes and twenty White Orpingtons.

About the first of June I usually have about one hundred young stock and from these select my next seasons breeders and supply my customers. I have only a city lot and am away all day during the week. I find from the past six years' experience on this place that I can care for and enjoy the above amount of stock very nicely and at a good profit for the investment.

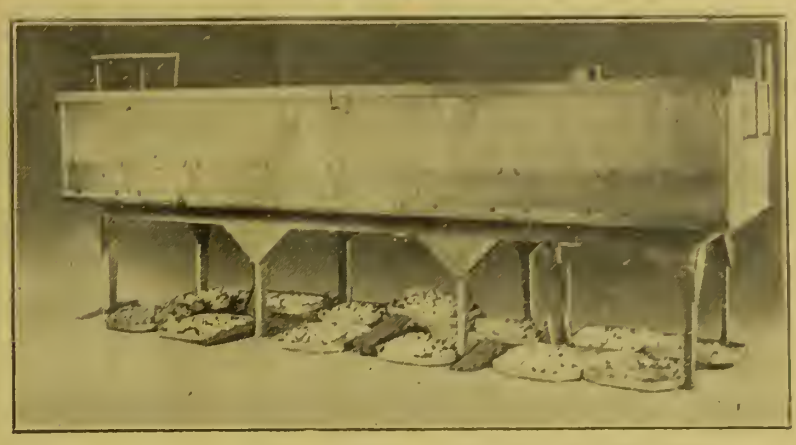
I prefer White Wyandottes and

"Chicks Well Hatched are Half Raised"

**San Jose Hatchery, San Jose, Cal.**

**Day-Old Chicks**

The Business Machine



One of our Incubators (2000 egg capacity) just after hatch.

A FEW WORDS FROM OUR MANAGER

To get strong chicks we must have good eggs. I am very particular about the vigor and vitality of the breeding stock from which I get the eggs to hatch the chicks we sell. They come from business utility flocks. Are true to breed, but not exhibition stock.

Quality of chicks is what I put first. I do not seek to hatch such a great quantity that people remark about the number of chicks the San Jose Hatchery turns out. But I do aim to hatch the very best chicks to be had, sparing no effort to do so.

There is more I would like to tell you now than these few words about quality. About our incubators and other things. But I am really too busy getting in shape for next season's work at our new place. We have recently removed to 563 Minor Ave., San Jose, where we have better facilities than formerly in many ways.

I shall answer correspondence promptly and all orders will receive my personal attention.

I would like to hear from you if you are going to buy chicks.

Yours very truly,
HENRY LANGENSCHWADT, Manager.

**San Jose Hatchery, San Jose, Cal.**

"Chicks Well Hatched are Half Raised"

**West Coast Egg Food**

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

**EGG-MORE**

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

$2.60 FREE. If you will send us the addresses of ten persons who have any fowls, we will send you, post-paid, our Biddy Booklet and an article worth ten cents, which many say no household should be without. If you will send us twenty-five addresses, we will also send you The Poultry Manual, profusely illustrated, by those high authorities, F. L. Sewell and Ida E. Tilson, a reliable work worth fifty cents, but free to you. For 100 addresses we will also send free, and expressage prepaid, another most useful article which sells in the East at $2. We merely want to send to them, by mail, some advertising matter, but your name will not be mentioned in connection with it in any way.

White Orpingtons because I admire a white fowl and they meet my requirements better than any other varieties I have ever kept. Space will not permit my telling all their good qualities, but if any one will write me I will give them in detail. I have never tried keeping a certain number of hens together for a given time to ascertain the cost of feeding per hen. I keep strict account of expenses and receipts and my little plant has been giving me a net profit of about $200 per year, I suppose I would average fifty birds the year around and that would be $4.00 per hen. I have made a net profit of $185 in seven months. This does not include eggs and chickens used on our table. My stock being so much better this season I will expect a banner year.

Most of the time I dry feed a balanced ration and buy one sack at a time as needed. For green food I use alfalfa meal. I mix it with the balanced ration. I also use lawn clippings.

My fowls are kept in yards eleven by thirty-five feet. During breeding season I keep 8 or 10 hens and one male to each yard. I use the shed roof house 6 x 8 feet, 7-foot front and 5 feet in back. The three sides are absolutely tight and are ventilated in front.

Yarded fowls do better if they have a scratching shed and I consider it very necessary. I use liquid lice killer on the roosts and go over them with lice powder about once a week. My plan of disposing of my products is in the first place cull out all the young birds that don't look first class and market them, I average 20 cents per pound live weight for culls and do it the year round.

This gives more room for the birds I want to save, I then exhibit at the Poultry Shows and advertise my winnings. In this way I keep doing business every month in the year.

For those producing eggs and broilers for market I should think a co-operative or central station method would be a good thing.

Yes, on the whole I do consider that for the labor and capital invested the poultry industry is profitable and has a greater future in this state, not for every one, mind you, but for the person adapted to it. There are many failures in all businesses and the poultry business has its share, but for the man that will work, plan and figure out the problems and profit by his experiences there are surely great things ahead in the poultry business for him.

* * *

**C. U. Chamberlin, Los Gatos, Santa Clara county.**

1. I do not produce poultry and eggs for market. I am breeding from pure bred stock for the purpose of furnishing my patrons the best stock of the breed of fowls they desire.

2. Keep from 150 to 600 fowls.

3. My especial favorite breed is the Rhode Island Red, because they are heavy layers, an excellent table fowl, good mothers, docile, and not heavy feeders.

4. The cost of feed per hen per year can only be given approximately as it varies from year to year. For yarded fowls this year it amounted to about $1.50, for those on free range not over $1.25. The profit also varies with years from $1.00 to $3.00 per fowl.

5. I feed the usual grains and mill feed, also meat in some form as a part of the daily feed, buying in as large quantities as we have room to store.

WHITE LEGHORN CHICKEN RANCH OF S. E. GREGG, RIVERSIDE.

6. For green feed I use alfalfa, kale, Swiss chard, and also barley sown after the rains begin and barley sprouted during the dry months.

7. Fowls are yarded, but yards are so large as to be nearly as good as free range.

8. Use open front houses with drop for bad weather.

9. Mites and lice are kept down so that they are never a menace, by the use of kerosene on the roosts and houses every few weeks, and good dusting places for the fowls, with a little tobacco dust in them as a help to the hens in keeping themselves free of lice.

10. No doubt there could be a co-operative society formed that would be a good thing. I expect the plan in use at Petaluma and Santa Rosa is all right if well followed and lived up to.

11. Yes. For the capital and labor put into it the profit is better than any of the usual farm productions like alfalfa hay, butter and cheese, or pork; more so than the usual farm crops of grain or vegetables. I look for a great future for the poultry interests. As the state fills with the incoming eastern homefinders, each family will desire its own supply of poultry for eggs and chickens to eat. The several new states and territories are to be supplied as well, and the demand for good poultry will increase for years to come.

**D. H. Hammons, Pacific Poultry Co., Inglewood, Los Angeles county.**

1. We produce poultry and eggs for market and are building up a strain of pure bred stock.
2. Keep 1000 breeders.
3. Keep White Rocks because most profitable. A whole chapter should be written on this point.
4. Cost of feed per hen per year is $1.20 and by my system net profit per hen is from $18 to $20 per year.
5. Feed mixed grains and dry mash, buying in car lots.
6. For green feed use alfalfa and vetch.
7. Fowls are kept housed all the time.
8. Houses are open front, permanent.
9. Spray every two weeks thoroughly with creolium and have no lice or mites.
10. An Egg Producers' Association should handle marketing of products to the profit of its members.
11. I most certainly consider that for the labor and capital invested the poultry business is profitable and has a greater future in this state.

* * *

**Mrs. Frank Metcalf, Inglewood, Los Angeles county.**

1. Am breeding my own strain of pure bred stock.
2. I keep from 50 to 100 fowls.
3. I am raising Buckeyes because I originated them and like their rich color and general excellence.
4. One dollar per year will feed a Buckeye hen, and I have made as high as seven dollars per hen, net profit, in the fancy.
5. In feeding I give a balanced ration, grains and dry mash, buying as needed.
6. For green feed I use alfalfa and beets.
7. My fowls are kept in yards.
8. I use open front houses.
9. Lice and mites are handled with distillate and spray pump, tobacco dust and tea and creolium.
11. I most certainly think if the same business training is given the poultry business and the same ratio of capital and brains employed, it has a great future in this and all other states. And its present output of $7,000,000, just market eggs and poultry, is not a small factor in finance.

* * *

**J. L. Harrison, Lake Ave. Poultry Yards, Pasadena.**

1. Owing to the perverseness of nature in failing to reproduce itself and the invariable reversions to ancestral types, all breeders are market poultrymen to a great extent. Fully 75 per cent of the males and 50 per cent of the females are technical culls, lacking in necessary shape, size or color or possessing some disqualification which renders them worse than useless to the conscientious breeder. The man who breeds his culls doesn't stay in the business long. Have bred my present strain for six seasons without introducing new blood and find the product stronger and better than ever.
2. Average 300 hens and raise 600 to 800 chickens yearly.
3. Rhode Island Reds exclusively. Have experimented with two colors Leghorns, same of Rocks and Minorcas and found them all profitable, but the Reds are in greatest demand and fill the bill for a general purpose fowl nicely. Business is good, so there is no use of exploiting their many virtues more fully.
4. The cost of feeding a hen for the last year is within a fraction of fourteen cents per month, say $1.65 per year. The Rhode Island Red hen does more October, November and December laying than any other breed known to the writer hence the net profit per hen is greater if all the eggs were marketed at retail prices the net profit per hen would be close to $1.75 per year, but as a good part of the eggs are sold or used for hatching, the actual net profit is not far from $4.00 per hen. In these figures no deductions are made for interest on capital invested nor for owner's labor.
5. Dry mash mornings, green feed noons and grain at night. Dry mash is conceded to be wasteful but the waste is more than evened up by the time saved in mixing and feeding, and fewer cases of sour crop and lesser death rate among the fowls. The mash formula is varied to suit season and conditions. No charcoal, tonics nor stimulants used at any time. Owing to the almost prohibitive price of wheat, sprouted barley and cracked corn have been substituted for the grain feed for the past year with most satisfactory results and considerable rolled barley is used in the dry mash. All grain is bought in ton lots for spot cash, thus effecting a saving of 15 to 20 per cent over retail prices. A high grade beef scrap and Croley's green bone is used liberally in the mash feed.
6. Lawn clippings from city parks at irregular intervals with a small patch of kale in the garden for fall use.
7. All fowls closely yarded. For every ten hens and one male a 16x36 foot yard is provided, furnished with hydrants and ample shade.
8. Closed houses every time and not a case of catarrhal cold nor roup in the 600 youngsters raised this year. In this particular locality there is too much climatic variation between day and night to fool with open front or mushroom housing.
9. Crude carbolic acid and water, once a week when the weather is dry and warm. The formula of one pint to six gallons is plenty strong enough when applied frequently. The spray nozzle should be thrown away, the rubber hose slit across the end and the pressure regulated by thumb and forefinger. For an even application the acid should be saponified. This may be done by the addition of lye or soda and a cheap oil. Heavy cylinder is good and less injurious to white feathers than the black crude oil of the coast. A quick and easy way is to use equal parts of the acid and Gold Dust washing powder. Nest boxes should be washed with sal soda water, three pounds to the gallon, and applied hot when convenient. This wash is effective when used on perches and hangers with positively no chance for soiling the plumage. Attend to the bug poisoning in person and do not delegate the job to the hired man. It is hard work but it is the one chore around the chicken houses that should be done most thoroughly.
11. A wealthy retired dry goods merchant once told the writer that twenty-four out of every twenty-five who embarked in his line of business failed, part from lack of capital and more from lack of experience. After reviewing a long list of poultry failures it is a pleasure to recall to mind several acquaintances who have made good. Intensive methods of yarding

and housing, while necessities to a breeder, are too expensive and laborious for a market poultryman unless he has dependable help in his own family. The Rhode Island and Petaluma colony methods pay in their respective localities and ought to pay in Southern California if land could be bought at fair prices. Good hard business sense and a working knowledge of poultry are necessary to the successful handling of a large poultry ranch. From the testimony of many who have tried keeping poultry on a strictly commercial basis, one is led to believe that year by year the net profit of a well managed plant is not far from one dollar per hen. And herein again no account is taken of the interest on the investment nor any charge made for the operator's labor.

Since 1902 the price of wheat has advanced 100 per cent while the advance in the price of poultry and eggs is not in excess of 50 per cent. Other grains have climbed up along with wheat, so the net profits from poultry are less than formerly.

One of the best combinations for Southern California should be citrus fruits and poultry, scattering the colonies around the grove. The trees would receive a much needed fertilizing and if the theory of $1.00 per hen profit worked out, the ranch income would be materially enhanced. The writer tried out this plan on a small scale some eight years ago and got most satisfactory returns both from oranges and poultry.

In many kinds of farming poultry should make a profitable side line and when the farmer states his poultry does not pay you may safely assert the fault it not in the chicken.

**Bee J. O'Mealey, Anderson, Shasta County.**

1. While in the business we produced poultry and eggs for private trade from pure bred stock.

2. The flocks varied at times from ten hens upward, always remembering that smaller flocks are more profitable than large ones; and when a large number is kept, not to exceed 20 are allowed in one enclosure.

3. The Barred Plymouth Rock has been most satisfactory for me, but when I embark in poultry keeping again I think I shall try Rhode Island Reds or some of the Orpingtons also. The Barred Rocks appeared to have a higher per cent of fertile egs, a less number of chicks died in the shell and infant mortality was less, while in point of size and egg production, they held their own against all comers.

4. I never depended entirely upon purchased feed, but had waste, garden and dairy products on which no value could be fixed, yet they materially reduced the feed bill, but it is higher than generally estimated. Also in actual practice the hen which

# HATCH YOUR CHICKS WITH A JUBILEE

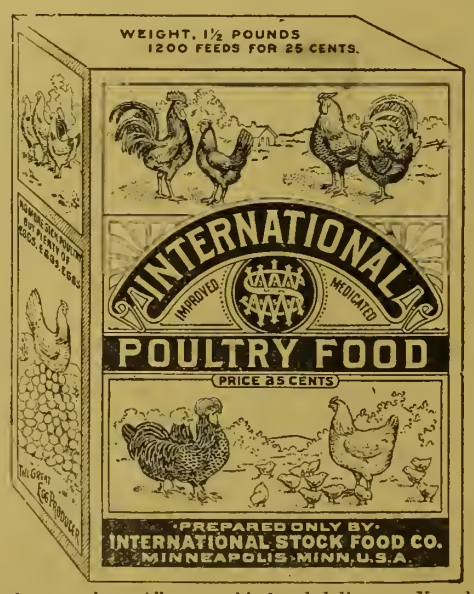
***Chicks well hatched are half raised. The Jubilee Hot Water Incubator is the best incubator made. Some of our most successful and largest poultrymen use Jubilees. Every machine guaranteed.***

## Darling's High Protein Beef Scrap

Fed by the leading poultry breeders of the United States. For analysis see Bulletin 164, Agricultural College, Berkeley, Cal.

## Ward's Fireless Brooder

Built to meet the conditions and climate of California. Send for special circular.

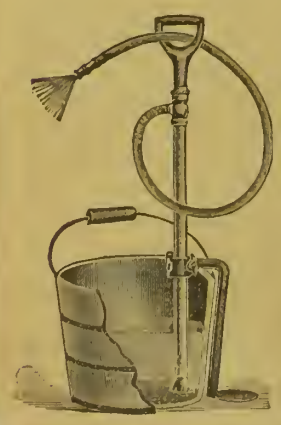


## International Poultry Food

The wonderful egg producer. The great production of eggs has given the "International Poultry Food" a wonderful reputation throughout every state. We guarantee that it cannot be fed to hens at any time, winter or summer, without showing a large increase in eggs. You do not have to use the food at an extra expense because it will make you more money after deducting its cost. One extra egg per month will pay the entire cost of feeding it and often more than double the supply. It contains no poisonous or injurious ingredients and has very superior merits.

Put up in 25c, 50c and $1.00 size packages, and 25-lb. pails $3.50.

**Only Costs 8 Cents a Month to Feed it to 12 Fowls.**



## The Prize Bucket Spray Pump

For white wash, guaranteed not to clog. All brass. Just the thing for spraying poultry houses.

## Conkey's Roup Cure

An infallible cure for this dreaded disease. You should always keep Conkey's Roup Remedy on hand. It will cure roup in all its forms. It is also excellent for turkeys and is the greatest remedy known for canker in pigeons. Send for special booklet, Poultry Diseases.

**Send for Our Catalogue. Everything for the Poultryman.**

# Germain Seed and Plant Co.

**326-330 So. Main Street, Los Angeles, Cal.**

produces 150 eggs per year is doing all that may be expected.

5. Grain, such as wheat, oats, barley or buckwheat in litter in the morning, mash at noon, corn, wheat or sunflower seeds at night, the feed varying with the time of year. Prefer to buy at harvest time enough to last the year out and buy of farmers if possible.

6. Cabbage, seakale and kale, and utilize all weeds pulled from the garden, also lawn clippings, particularly white clover.

7. The best practice so far as the fowls are concerned, is to yard the garden and lawn and give the fowls range but it is not always practicable to do so and the losses are less when the hens are confined until noon.

8. In this climate the open front house might do, but we always used a stationary house, well built and fully enclosed.

9. By eternal vigilance. We grew tobacco for nesting material, used air slacked lime freely for dust-baths and to cover dropping board. Everything about the building must be white washed every spring, twice a year is better and kerosene put in all crevices with a machine oil can as often as necessary. Occasionally in spite of all this it has been necessary to grease neck, vent, under wings and legs with lard, sulphur, insect powder and a touch of kerosene or crude carbolic acid, taking care that the two latter ingredients are not strong enough to burn.

10. We never entered the general market, having private customers who ordered their dressed poultry in advance and had standing orders for eggs each week. The general market conditions seem grievously unsatisfactory both to seller and buyer but am unable to suggest a remedy.

11. There is certainly a great field for those so situated as to produce the greater part if not all of the feed consumed, but the person who goes into the business without experience, and attempts to buy in small quantities is doomed to disappointment. It is not an enterprise which can be made profitable without capital or experience and beware of short cuts, secret processes, etc., for they are profitable to no one but the promoter.

* * *

**R. B. Hayes, Garvanza Station, Los Angeles.**

1. This is an egg market, not a poultry one. There are no poultry raisers except in one instance and that at Inglewood. I am keeping a combination, utility and fancy for the egg trade.

2. At present have 900 birds.

3. I prefer Rhode Island Reds, medium size bird, good layers, good poultry and popular.

4. Cost per hen per year about $1.60; net profit on utility basis $1.25; net profit on utility and fancy basis about $2.50.

5. Sprouted oats in morning, green food at noon, two-thirds cracked corn and one-third wheat at night. Dry mash in front of birds at all times. Dry mash formula consists of 3 parts bran, 1 part corn meal, 1 part ground oats, 1 part beef scraps. Shell, grit, and charcoal also in front of birds. Buy in 2 ton lots.

6. Do not grow anything at present. My green food is chiefly lawn clipping, which costs 10 cents per sack. Also get lettuce from the market.

7. Both yard and range. Believe a pullet should be yarded when she matures.

8. Open front houses.

9. Spray once a month with kerosene, crude carbolic and paint roosts with lice killer. Twice a week on

cleaning days we sprinkle with air slacked lime.

10. There is now a co-operative poultry supply and distributing company. Believe it is working very successfully.

11. To anybody having enough capital and wishing an out door life it is a fine business. When percentages are considered the returns on the investment are high.

It is a well known fact that our supply is not even keeping up with the increased demand for eggs and poultry. Lack of knowledge of the business and lack of capital are the sticking points where the failures occur.

* * *

**Charles E. Winslow, Red Feather Poultry Yards, Monrovia.**

1. I am not producing poultry or eggs for market. Am breeding to build up a strain of winter layers—and birds as true to Standard requirements as possible.

2. I have from hour hundred to over a thousand birds in my yards all of the time.

3. I breed Rhode Island Reds, both combs. I prefer them because I believe they are the greatest winter egg producers of all breeds, and hold their own as layers throughout the year with the best. I say this advisedly, having bred Asiatics, Mediterranean, and other American breeds. They are a fine table fowl, good setters and careful mothers.

4. It is almost impossible to estimate cost per fowl, when I am continually selling stock, but the profits are good.

5. This season, on account of the high price of grain, I changed, to some extent, the rations I have used in the past, and found while reducing the expense of the feed, that I have had in every way as good results. The chicks get nothing but feed meal and

S. C. R. I. RED PULLET BRED AND OWNED BY DR. C. E. WINSLOW, MONROVIA.

water the first week, and bran, and beef meal and lawn clippings the second. Get them to eating wheat as soon as possible, stop it when they leave the brooders. Change feed meal to cracked corn as soon as the chicks will take it, and keep it before them until they are full grown. Then bran, six parts to one of beef meal, all the rest of their lives. Every morning feed all stock, except brooder chicks, a moist mash, containing six parts bran, two shorts, one beef meal, giving just what they will eat up clean at once. At night, rolled barley that has been in soak since morning, enough so there will be a little left to eat as soon as they are up the next day. After this feed I make the rounds and throw into each breeding pen a handfull of cracked corn in the way of dessert. Keep bran before them all the time, and give plenty green stuff in the way of lawn clippings or cut alfalfa. When unable to obtain these I substitute alfalfa meal for one or two parts of bran in the morning feed. I get my feed in five sack lots, ton rates. would buy in larger quantities if I had the room.

6. Use lawn clippings.

7. Keep breeding stock in yards 20 to 20 and 20 by 40, one or two good sized orange trees in each yard for shade. Have two yards of one-eighth acre and two of one-fourth each full of orange trees, in which the growing stock is kept.

8. I use open front movable houses, with door hanging from the top, which is kept up at an angle of 60 degrees the year round, except

FIRST PRIZE R. I. RED COCK OWNED BY DR. C. E. WINSLOW, MONROVIA.

with very young stock, when it is sometimes closed in cold weather.

9. I use the crude carbolic acid for a spray, going over the roosts, and the lower edges of the coops, if occupied by young stock, and nests one a month. The coops are gone over thoroughly two or three times a year. Never put a setting hen on a nest that has not had a good spraying with acid a day or two before, or in a coop with chicks that have not been treated in the same manner, using some good insect powder freely on hens and chicks.

10. Yes. I believe that the Egg Producers' Association of Southern California is organized on the right lines and will win.

11. I answer this with a decided yes. If the same judgment is used in going into the poultry business as into any other business there will be the same proportion of success. The larger number of those who go into the poultry business are unprepared for the undertaking. They have a mistaken notion that it is an easy way of making a living, or that "anybody can raise chickens," and with a head full of "hit or miss" ideas, and no practical knowledge on poultry raising, buy an incubator and eggs enough to fill it, or a bunch of chickens, usually a scrub lot, "because they are cheap," and at the end of a few months find money gone and no profits coming in, sell out at a loss and declare "there is no money in chickens." Or the beginner with more means, possessing no more knowledge or experience, builds expensive buildings and yards, and fills them with high priced poultry, to find that the "income" will not balance the "out go" and while he lasts a little longer than the former, he too becomes disgusted and adds another to the "no money in poultry." It is as ridiculous to expect a rancher to go into a drug store without a knowledge of the business and succeed, as for a man or woman with

no experience in raising chickens to make a success in the poultry industry.

There is a great future for the poultry industry in the state and the next few years will show a wonderful advance in poultry culture. The outlook was never so bright, and now is the time to take advantage of the opportunity offered. Those who have been most successful in the poultry industry, are those who have commenced in a small way, and grown into the business. The way to success is to make a study of the business, decide on the breed, get a few of the best, and while the flock is increasing in numbers, the breeder will be growing in knowledge. Make the chickens pay for the improvements, and in a year or two the plant will have grown into a paying investment.

* * *

**Mrs. C. H. Vary, Pomona, Los Angeles County.**

I am very fond of my Brown Leghorns and when I first started I learned to like the ones best that were nearest to the Standard so when any had to be sold it was always the poorest. Whether we are in the business for market eggs or fancy our

ALASKA.
First Prize Pullet A. Y. P. Exposition, Owned by Frank E. Baldwin, San Jose.

aims are the same in many ways. My profits would not be large if I had a flock of prize winning Brown Leghorns next spring that were not shelling out eggs when my orders were coming in by the hundred and for settings. I have never kept accounts so I could tell the cost of feeding a hen for a year but I know my profits were good before I began selling poultry and eggs at fancy prices. I can find no breed that suits me as well. What is prettier than the Standard shaped Leghorn with the solid black hackle edged with yellow, the salmon breast, and the soft brown of the hen.

My birds have hoppers before them all the time filled with Coulson's Improved Egg Mash to which has been added a little salt, charcoal and alfalfa meal. To my cooked potato parings I mix some of the dry mash for their breakfast. I find they relish alfalfa meal much more when moist than they will eat in the dry mash. At noon I like them to have clippings from our clover lawn and at night I feed all the wheat they will eat. This cool weather I am adding about one-third cracked corn or Egyptian corn to the wheat. I am not afraid of over feeding. I feel there are more Leghorns underfed than over fed.

I like the open front houses best. I do not like the houses at all with space all around the bottom. I had one and was always worried for fear a bird would fall off the roost in the night and be in a draft, so had the house built over.

My houses are sprayed with Lee's lice kiler and coal oil nearly equal parts. If a house is sprayed once a week I can hardly think there will ever be a mite in existence. I powder my birds several time a year with insect powder and in that way keep them very free from lice.

## WHY WE BREED BARRED PLYMOUTH ROCKS.

**By D. T. Wieland, Moneta.**

BECAUSE we are fully convinced from actual tests that these are the best all purpose fowl in the world today. They are the standard by which all market poultry are judged. Ask any dealer in poultry, and he will tell you that all yellow skinned dressed poultry go into the Plymouth Rock grade, the highest of all. All others go into the second or third grade. He will also tell you that they set the price on poultry.

The Barred Plymouth Rocks, as we have found them, are beautiful birds to look at. Their nice barring, rich yellow legs, bright red combs, symmetrical form, make an ideal bird, and when bred to standard shape are a mighty good business fowl.

The young grow very rapidly, are hardy, rugged rustlers and at an early age are ready to fry or broil. As roasters none can compare with them. One especially strong point in their favor is the ease with which the youngsters can be dressed. You need not fear the breaking or tearing the skin of a fryer. It is an awful job to dress a one and a half pound chicken of many of the other breeds, as their skin is so easily broken.

I have raised Barred Rocks twenty years. In this time I have raised also 13 other different breeds. As cash getters they are the best we have ever tried and I feel sure there is nothing in hendom at this time which is their equal. They may be produced sometime in the future but are not on top at this writing.

As layers, you can get pretty nearly anything you want if you know how. I have had hens lay 250 eggs in twelve months. You can do the same. The one thing I like above all else in Barred Rocks is they lay every month in the year. They don't make you tired carrying eggs to market in the good old summer-time when eggs are plentiful and cheap. Neither do they try your patience running from yard to yard daily in quest of eggs, without getting them, when eggs are scarce and high.

Those who wish to raise poultry for the largest amount of profit, may rest assured of success if Barred Plymouth Rocks are chosen, providing they manage correctly. While the breeders and fanciers of the Barred Rocks are in love with them they do not fail to recognize other good breeds, and many of them.

One nice feature in this noble breed is their color; it is such that always looks clean. They always look dressed up, city, town or country, all the same, always bright, never dirty. Then, too, you can keep them yarded or on range—they do equally well. They are good foragers if given their liberty.

I would recommend the first and best of the American production, the Barred Rocks. Get the best you can afford, study them and I venture the assertion you will always be satisfied and pleased with them. No matter how you are located, the cold and warm is all the same to them, they prosper under any condition and so will you, for you will have that satisfied feeling of choosing the best.

Just a hint on breeding:

Keep your light males and light females together. Your dark males and dark females together. The pullets from your light mating will

be your best exhibition females. The cockerels from your dark mating will be your best exhibition males. This is so providing your fowls have been bred along this line, and we believe this the better way to produce the colors now demanded by the Standard. We have tried mating our best exhibition males with our best exhibition females with rather poor results, the males come too light, the pullets too dark for show, so we just gave it up and breed the lines separate now and have for a good many years, with very satisfying results. I cannot go into details on mating in this article as it is already too long. I may sometime in the future give our system. It has proven a success with us and others that have tried it.

We would make out a poor guess as to what the future has in store. We expect great things. The breed is in the best of hands, and it has within itself the characteristics that have so successfully guided it for the past forty years, and that will keep it at the head as the most desirable quality breed for all time to come.

## CONCERNING ARTIFICIAL INCUBATION.

By M. A. Schofield, Proprietor Gardena Hatchery.

YEAR by year our business increases almost in geometric ratio, so that now our associated hatcheries put out more chicks, probably than any other concern in the world. But even so, we approach such a topic with a certain reluctance and hesitation. We feel like giving a little caution and advice only when we read the half digested subject matter offered by those who make a good hatch or two and then hurry to teach their fellow men with gleanings not from long experience but rather from the poultry press. It is the study of a lifetime, wide in its bearing, but we are asked to confine ourselves to the "practice" part and we shall endeavor to stick to our text.

We are not interested financially in any incubator on the market. What we try to get is a maximum number of chicks with the greatest amount of vitality and the following tells a little of how we try to do it.

You will find it pays to select the best eggs for incubation if you have plenty to pick from. Take about one-half, the evenest in size and shape, of good shell and smooth to the touch. They should be kept from evaporation in a clean can or a tight box covered with a heavy cloth. When weather is warm, air at night so as to keep temperature as near 58 or 60 degrees as possible. Supposing your eggs were exposed to dry air for three weeks before placing in the incubator, then the natural evaporation is about as great before your eggs even go into the machine as it should be were fresh eggs run three weeks in the incubator. I mean it will be similar in amount to that of infertile eggs run three weeks in a machine. In dry weather hatching eggs will not stand such a handicap, but in wet weather there is naturally little occasion to prevent evaporation.

I once placed a dozen eggs on top of an incubator for two weeks and when placed in the machine they tested 100 per cent. strong germs, but it rained nearly every day. When your incubator runs evenly, close all the ventilators you can and put in

## 1030 Chicks From 1047 Eggs

IN three hatches. That's what G. W. Ormsby, of Piermont, Ohio, did with a Standard Cyphers Incubator. He don't claim to be an expert—just a practical, money-making chicken-raiser. But he insists on the best hatcher.

**CALISTOGA, CAL.**

your eggs, flat on the tray, not on end. We don't even fill our machines full but leave a space empty on one end of the tray. Hold the temperature even the first six days if you want a hatch. Run your tested thermometer at 103 to 108½ degrees for 36 hours if you cool twice a day, otherwise one-half degree lower. After 36 hours run one-half degree lower in either case. Small eggs should be run higher than large eggs, brown eggs, than white eggs and also young hen's eggs higher than old hen's eggs. This is owing to the density of the shells. Above all don't neglect the eggs in the beginning—it is the first six days that make the hatch; nearly all crippled legs and toes are made the first week, and most of the chicks dead in the shell are those that never got a fair start. See that temperature is not down in the morning even if you have to get up about 3 o'clock and turn on more blaze. The temperature should stand high in the morning—I am speaking of the first week, the last part makes less difference.

Don't be in a hurry to turn your eggs, but once a day from the start shift the position of the trays and once a day move the outside row of eggs towards the middle. This makes two changes per day. When the eggs are tested the moving in need not be done every day.

I hear one object rather strenuously that he or she does not do all that and yet "good" hatches result. It is demonstrated in our plant that it is possible to get off a hatch week after week for months at a time in 20 days and 12 hours, not varying more than 2 or 3 hours either way. It is possible as shown in our plant to hatch 2500 chicks, the usual output of one of our machines, and have from 3 to 15 leg cripples, depending on the breeds hatched, and if my objector can't do that, he or she has something to learn.

Temperature is everything at first. Keep that steady if you can't do anything else. Except in the hot interior valleys don't let any one confuse you on the moisture question nor fool you into dipping your eggs in some proprietary article to kill germs. There are a lot of confidence men in the world but it does seem that the would-be poultry keeper has more than his share. For the first ten days keep your temperature even, night and day. Cool slightly twice per day and in turning the eggs shift their position on the tray.

Now then, when the allantois begins to nearly cover the inside of the shell the embryo has reached a stage when rapid oxidation is taking place. This is shown by the increased animal heat. Nature has it arranged so that when a hen finds the eggs growing too hot for her comfort she raises her body up slightly to cool them. This is done more and more often as oxidation becomes more rapid, producing more heat in the eggs. From the time the allantois nearly covers the shell, the chick is not at the mercy of high or low moisture tension. Within reason, the healthy embryo regulates evaporation to suit itself. This in our machines so far as the eye can detect the evaporation at a given stage is the same whether it rains every day or whether dry winds blow from the interior. Such being the case, open the ventilators gradually or if your

(Continued on Page 599.)

# Metal Incubators and Brooders

Brooder-Hatcher Doing Double Duty

The demand for a practical, simple and inexpensive Hatcher and a closer study of the principles underlying the natural process of incubation has enabled us, after 20 years of practical experience in incubating and brooding, to place on the market the Cycle Hatcher which has been thoroughly tested out for the past five years and which we believe more closely follows natural methods than any other form of incubator heretofore produced.

All the necessary essentials are provided; a warm nest, a heater to take the place of the hen and the means of supplying a sufficient quantity of fresh air, at the same time retaining the natural moisture contained in the egg and preventing its escape. The heater being circular in shape with the lamp directly in the center insures an even distribution of heated air in all parts of the machine with no corners for dead air spaces.

Eggs to hatch well must be newly laid and where the number produced is small they will not be as fresh when several hundred or more are placed in one incubator as when set more often in separate machines. For this reason we make only one size holding 50 eggs and for large hatches the required number of machines are used, thus by having the eggs in small units they can be more readily controlled and there is never the danger of an entire hatch being ruined.

The advantages of a small hatcher are many, as a practical poultry keepers will readily see by a careful consideration of the requirements for successful incubation.

CATALOGUE ON REQUEST

## A Bit of Boasting.

THIS BEING A POULTRY NUMBER, and so "filled with feathers," we doubt not we may be pardoned if a small sized "crow" is allowed to escape. Hence we ask our readers to take a long distance view of this issue of the Cultivator. That is, hold it at arms' length and run through its various pages noticing the amount of original reading matter and especially the invitations of our advertisers to our readers. This issue contains 60 columns of these advertisements and we think we can safely say every one of them is from a reputable and perfectly responsible firm. In fact, the Cultivator will receive advertisements from such firms only. Further than that it may be noted that patent medicine and all liquor advertisements are refused admission to this paper. Offers for this class of advertising are made to the business office every week in the year, and while the money may look good, the fact that the Cultivator is to a large extent a home paper, compels us to refuse all advertisements of a questionable nature. We do not believe a cleaner line of advertising can be shown by any other paper in the country.

It is especially gratifying that this issue contains a greater number of advertisements than have ever before appeared in the Cultivator. If you will count them you will find about 236 advertisements aggregating 818 inches. All these are from reputable advertisers wishing the trade of Cultivator readers. If this proves anything it proves that the advertisers have knowledge of conditions of Cultivator patrons and know their greater capacity to buy.

Space which these advertisements occupy is not by any means lost to the average reader. That is, we mean the valuable features of the Cultivator are not entirely enclosed in the columns devoted to reading matter. Glancing over the advertising pages of a paper filled with the class of announcements contained in the Cultivator is an education to the farmers. It keeps them in touch with the most up-to-date appliances and machinery. But notwithstanding this we endeavor to keep our advertising space in limits, or rather by enlarging the number of pages to keep up a proper average of reading matter. This accounts for our paper at this time having 32 pages instead of 24, which has been our regular issue for several months. From contracts now in hand it appears there will be several months more in which we will issue a 32 page paper.

No other Coast farm paper is giving such service as the Cultivator. This may account for the fact that this issue is the largest in the number of papers sent out which this or any other agricultural weekly of the Coast has never mailed.

Hence this "crow" for which we trust you will pardon us.

## American Breeders' Association.

THE SIXTH ANNUAL MEETING of the American Breeders' Association will be held this year in Omaha, Nebraska, December 8, 9 and 10 at the same time as the National Corn Exposition. This association is not composed entirely of animal breeders by any means, but will discuss in its session the breeding of grains, sorghums, barley, wheat, and cotton, etc. Of course, one day of the discussion will be given to animal breeding besides.

Much has already been achieved by breeders. The magnificent herds and studs scattered over North America are sufficient evidence that our animal breeders have not been idle and that they have builded wisely. The achievements of the breeders of field crops and horticultural plants have provided our modern journals and the daily press with material eagerly sought by a public which appreciates the wizard-like creations of these workers in plastic living forms. The productions of our florists and nurserymen brought forth in response to a popular demand for the artistic and novel, to the student of heredity, are monuments to the skill of the breeder and indicate the stupendous possibilities of similar work with our great economic animals and crops.

## None of Our Business.

AMONGST THE QUESTIONS answered in this week's issue of the Cultivator, Number 4 asks: "Can you give cost of feed per hen per year, also net profit per year?" This was answered with some spirit by Mr. Gregg of Riverside, in effect that it is none of our business as to the profit derived by anyone engaged in other businesses. As he says in his paper: "No one would expect to ask the publisher, the baker or the candlestick maker as to profit derived from his business, but the poultry man seems to be in a class by himself in this respect." In fact we may say that the entire farming class is in the same situation in this particular. Fruit growers are repeatedly importuned by boosters for the community to tell how profitable has been their venture in the production of fruit. They are asked to give itemized statements of the cost of growing an orchard and of the net profit for each year. This is because of the desire to show the world the possibilities of our climate, soil and water, and induce newcomers to locate and produce more wealth. This is a proper and legitimate effort, and yet as Mr. Gregg says, questions are often asked about details of a business which are the concern only of the one who has invested capital time and energy in it.

But fortunately the poultry industry is in little danger of being overdone in California, so we think there will be no probability of the figures given by our contributors this week causing overproduction and a consequent slump in poultry profits. We have asked of the poultry people a question we had no real right to ask, and we thank them for the spirit they have all shown in their answers which are convincing arguments for the advantages of this great industry.

## Frost Prevention.

THERE IS SO MUCH OF POULTRY in this week's paper that it is possible one most valuable article written by Prof. Alex. McAdie of the U. S. Weather Bureau at San Francisco, may be overlooked. This article deals so fully with the principles of frost protection that it will make most interesting reading for those who are raising crops which are affected by sudden fall of temperature.

## Farmers' Institutes for Bee Keepers.

A SERIES of special purpose Farmers' Institutes for Bee Keepers has been arranged for at various points over the State. As far as possible these institutes have been placed in the bee keeping sections of the State, especially where there are organized beekeepers associations to co-operate with. This institute for the central coast counties will be held in the Chamber of Commerce at Monterey on December 14th and 15th. This gathering will be under the auspices of the California Central Coast Bee Keepers Association, and the opening session at 1:30 o'clock on the 14th will be given over to the annual business meeting of that organization, after which the regular program of the University institute will proceed.

On December 17th and 18th jointly with the Northern California Bee Keepers Association there will be an institute held for bee keepers at Pioneer Hall, Seventh Street, between J and K Streets, Sacramento. The annual business session will take place at 10 o'clock in the morning of the 17th and at 1:30 o'clock in the afternoon the institute program proper will begin.

For the beekeeper of the San Joaquin Valley an institute has been arranged for at Tulare on December 20th and 21st, beginning at 10 o'clock of the first day. The local committee in charge of this institute is the executive committee of the Tulare Bee Keepers Association, under whose auspices the institute is being held.

In Southern California where local bee keepers associations are not yet well organized, the University's representative Mr. J. B. Neff, of Anaheim, conductor of Farmers' Institutes for Southern California, has arranged with local committees of representative bee keepers, for two institutes: One in the Ventura district to be held at Santa Paula on December 22nd and 23rd, and the other in the Riverside District to be held in the City Hall at Colton on December 29th and 30th. These two institutes will both begin at 10 o'clock in the morning on their respective dates and will be conducted by Mr. Neff.

All bee keepers are requested to be present at the institute held nearest to their home, and to bring with them samples of honey and wax to contribute to the institute exhibit. Excellent programs have been arranged for and all are requested to take part in the discussions. The following are some of the subjects to be presented:

"Farmers' Institutes and What They are For."
"Honey Yielding Plants and How to Utilize Them."
"Modern Equipment Available for the Bee Keeper."
"Problems in Bee Breeding."
"Improved Methods of Queen Rearing."
"Building Bees up for the Harvest."
"Moving Bees to Increase Returns."
"The Chemistry of Honey."
"The Latest in Bee Diseases."
"The Rendering of Wax."
"The Selection of a Location for an Apiary."
"Bee Disease Control Work."
"An Up-To-Date Apiary."
"Producing Comb Honey."
"The Products of the Apiary—Honey, Wax, Vinegar."
"Marketing Honey."
"Co-operative Marketing."
"Protection from Ants and Other Insects."

# Agricultural News Notes of the Pacific Coast

## Northern California

Large quantities of timber lands have recently been sold near Susanville, Lassen county.

The rain which visited various parts of the Sacramento Valley last week was most welcome.

Tehama county turkey growers shipped from Corning over 1000 pounds of dressed turkeys.

Fair Oaks and Orangevale, Sacramento county, have been shipping oranges to Portland, Oregon.

A company of Easterners has bought 720 acres near Elmira, Solano county, and will plant eucalypts.

Alexander Valley in Sonoma county is reported to have developed a new industry in the "gathering and selling of grasshoppers."

Vallejo, Solano county, proposes to reorganize its chamber of commerce and get it in line with other boosting organizations of the state.

The early fall rains have started the green feed of the northern coast counties so that the outlook for a big output of butter is the best.

District No. 70 in Sutter county has completed its raising of the levees and they are now thought to be entirely safe from the winter's floods.

Modoc county's supply of water from the first of the month storm was such that great damage was done by high waters in all low land sections.

One prune grower at Woodland, Yolo county, estimates that that county has lost three-fourths of its output this season owing to unfavorable weather conditions.

The forestry board of Sacramento county is recommending certain trees for the various streets of the county and proposes to proceed as rapidly as possible in uniform planting.

Orange trees at Redding have been found by the horticultural commissioner to be infested with mealy bugs. A hot fight is promised to endeavor to rid the trees of them entirely.

Fruit shipments from Vacaville for 1909 total 1022 cars. The last car was shipped about the end of November. This shipment was never exceeded except for the year 1903 when the shipment was 1143 cars.

The Truckee lumber company is planning to build immense mills at Oroville for manufacturing. It is now running a railroad line into the vast timber holdings of the company.

The Butte county olive harvest is proving to be an exceptionally large crop of choice fruit. One plant at Oroville is turning out 4000 gallons of pickles daily and is still behind with orders.

The supervisors of Nevada county have appointed Newton Peck to be the first county horticultural commissioner under the new law. He is the first horticultural commissioner ever named in that country.

Sacramento county has a forestry board which is making suggestions for plans of planting trees along the roadsides. One suggestion is that the camellia, while only a shrub, shall be a leading factor in all Sacramento Valley ornamentation.

## Central California

It is estimated there are about 25,000 tons of raisins yet to ship.

The Tulare County Citrus Fair held at Dinuba last week was a complete success.

The new weir at the head of Last Chance ditch near Hanford has been completed.

Elias Gallup of Tulare, is breeding some of the old fashioned rose comb Dominiques.

The recent creamery operators' convention at Porterville elected C. C. Richway, president and J. H. Severin, secretary.

Inspection by careful entomologists of the orchards near Porterville has failed to bring to light any case of orange thrips.

Raisin producers representing over 4800 tons of muscats recently met in Fresno and decided to hold for a minimum of three cents.

P. J. Dreher, secretary of the San Antonio Fruit Exchange, at Pomona, is planting 80 acres of oranges near Porterville, Tulare county.

Tulare county oranges have been running larger size than usual and have been accepted in Eastern markets at very satisfactory prices.

Stanislaus county has shipped a fine display of raisins, walnuts, pecans, almonds, and other productions to the Corn Exhibit at Omaha.

Beekeepers of Tulare county will hold a farmers institute in Tulare under the University of California direction December 20th and 21st.

The raisin situation is said to be improving constantly and the consolidated packers are asserted to have withdrawn the eastern "cut rates."

The quarterly meeting of the Kingsburg Beekeepers' Association met this week at Hanford, Kings county. Foul brood was the principal topic of discussion.

First shipments of oranges from Porterville section netted $2.10 f.o.b.

Fruit packers at Gilroy report over 2000 tons of dried fruit for that section this season.

One stock owner at Hanford has been arrested and fined for not killing a horse which he had been ordered to kill by the state veterinarian because of glanders.

Many buyers have been approaching raisin growers with a contract to take their raisins for three years for three cents a pound, this to cover the years 1910, 1911 and 1912.

Orange growers of Tulare county have formed a co-operative company to develop more power along the Tule river. This is now termed the "busiest" river in California.

A special agent of the United States Bureau of Labor Statistics is studying the situation with regard to employment of orientals. The work at present is in Tulare county.

There is a project on hand at Sanger, Fresno county, to build a million dollar dam at Pine Flat twenty miles east. If carried out, it will reclaim thousands of acres of acres of farm land.

## Southern California

Ventura county is having trouble with cattle thieves.

Anaheim, Orange county, shipped its first car of oranges November 28.

The cotton gin at El Centro is handling about five bales of cotton daily.

San Bernardino county produced last year about 300,000 pounds of honey.

The walnut output of Saticoy, Ventura county, amounted to about 63 carloads which was the largest output ever.

The cool weather all over Southern California last week has hastened the coloring of fruit.

Farmers in the Coachella Valley are now considering the production of cotton in that section.

Anaheim, Orange county, hopes to have a $40,000 flouring mill established in the near future.

El Centro is holding a county fair this week at which the principal day will be called Cotton Day.

At the farmers institute held at Coachella on Monday exhibits of fruits and other farm products were made.

Celery shipments from Orange county have been rather slow owing to limited quantity of well bleached stock on hand.

The U. S. land office at Los Angeles has received instructions to suspend all applications to enter land in Imperial Valley.

Twenty tons of iron are required for the pipe which is to be used in constructing the flume across the Alamo river in Imperial county.

There seems to be a general lethargy in cantaloupe planting in Imperial Valley and it is now thought the next season's acreage will be the lightest in years.

Fullerton has shipped practically all of its walnut output for this year, which is about 90 cars, or practically twenty-five per cent short of the average crop.

Lemon growers who have not joined with the Citrus Protective League to secure the reduced freight rate, are compelled to pay the old rate of $1.15.

The bee men of San Bernardino have taken the first step toward forming an organization for better protection of the industry, the work of which is expected to be completed at the bee keeper's institute to be held at Colton December 28 and 29.

G. Harold Powell and his assistants who have been investigating the decay of lemons in transit, have determined that the only remedy is more careful handling of the fruit in picking, packing and shipping. These experts will soon go to Florida.

The Santiago Orange Growers' Association at Orange, Orange county, held its annual meeting last week at which the following directors were elected for the coming year: D. F. Campbell, S. J. Beals, J. A. Maag, A. H. Stutsman, Jay W. Powers, W. H. Burnham.

## The Coast

Dairymen near Yuma, Arizona, are shipping cream to the Imperial Creamery.

Wenatchee, Washington, has shipped over 100,000 boxes of apples this season.

Yuma Heights, Arizona, is now marketing some exceptionally fine grape fruit.

Ninety per cent of the prune crop of the Salem, Oregon, district has been marketed.

A single Hood River apple shipped to Cincinnati and sold at a church fair netted $3.75.

The college of agriculture of Idaho is holding a series of farmers institutes this week.

Spokane wheat growers are holding their grain rather than sell at one dollar per bushel.

Farmers at Appledale, Washington, held a barbecue and dinner on Thanksgiving Day.

There is great demand for bluestem wheat on the part of Oregon and Washington millers.

Over 6000 bales of hops were purchased about the first of the month in Portland for export.

Ungathered apples were badly damaged by early frosts in Eastern Washington and in Idaho.

Offers of $1.03 are made for wheat at Walla Walla, Washington, with few producers accepting.

Chelan county, Washington, took 58 per cent of the awards at the National Apple Show at Spokane.

The state highway commission of Washington are suggesting a chain of state roads to various parts of the state.

The Inland Registered Stock Breeders' Association held its annual convention at Moscow, Idaho, December 3rd and 4th.

The sugar factory at Waverley, Washington, finishes its run this week with an output of about 70 carloads of sugar.

The entire Northwest was visited last week by storms and floods which did great damage in nearly all agricultural sections.

One apple grower at Elgin, Oregon, is experimenting with planting apple trees amongst the stumps on land from which the timber has been removed.

The turkey market at Portland was completely cleaned up this year so that the usual Thanksgiving eve auction was not held because of no stock.

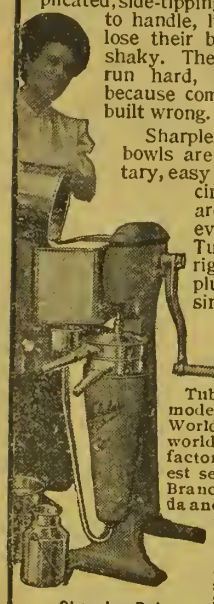
A recently completed irrigation scheme at Two Rivers, Washington, will carry the water two miles from the river and irrigate several hundred acres.

It is said that the Senate Irrigation Commission during its visit at Phoenix, Arizona, stated that if the effort were made to amend the Irrigation Act so as to extend the time of payment for irrigation improvements under the Reclamation Act, that they feared Eastern senators would combine and repeal the entire act.

# Not Alike

Sharples Dairy Tubular Cream Separators are unlike all others.

Common separators have heavy, complicated, side-tipping bowls that are hard to handle, hard to wash, sure to lose their balance, sure to get shaky. Then they waste cream, run hard, wear out. That is because common separators are built wrong.



Sharples Dairy Tubular, World's Best

Sharples Dairy Tubulars are light, simple, sanitary, easy to clean, self-balancing, always run easy, are guaranteed forever. That is because Tubular bowls are built right — hang like a plumb bob below a single practically frictionless ball bearing. Patented. Cannot be imitated.

Tubulars are the only modern separators — The World's Best. Made in the world's biggest separator factory by America's oldest separator concern. Branch factories in Canada and Germany. Tubulars probably replace more common separators every year than any one maker of such machines sells. Sales easily exceed, most, if not all, others combined. Write for Catalogue No. 260

# Live Stock and Dairy

Dairymen and stookmen are requested to write of their experience. Mrs. Sherman is always willing to answer querles and this, with experience of other workers, will make this department of greater value.

## ALFALFA.

By Mrs. M. E. Sherman.

THE past two weeks of Farmers Institutes has brought to mind a convincing evidence that the people of the great valley are more interested in alfalfa than in any other one subject placed on the programs. The questions in the box and the discussion on the floor kept drifting back to alfalfa. The director had to call the people back to the subject in hand, of hens, of good roads, spraying and fruit trees. The questions will not down, for here on my desk are letters asking from one to many questions on the same subject of alfalfa. One man says he did not think the Institute worth attending but wants now a letter at least as long as this article to answer his questions. I replied to him that the Institute at Kerman would be near enough for him to attend. While one may be ever so willing it is hardly fair to ask the Institute instructors to go over their work in personal letters.

### History.

What a long historical time many of the common plants have lived through! It seems all right to think of the giant trees as having been on this earth for long periods but when it comes to the alfalfa plant it seems more wonderful that it was never destroyed or lost to the world. The Bible says there is nothing new under the sun and the truth grows upon us as we study these small plants. The same animals, the same plants, the same joys and the same sorrows have filled the world from earliest times. Yet there are people who presume to think themselves of superior clay to the rest of the human family. The simple little alfalfa plant has a pedigree longer than the human race. The alfalfa plant goes back to the beginning of agriculture. It is older than the Pharoah whose mummified remains are now in New York, worth $300,00 as a mummy but useless except as a museum freak, an illustration of the folly of the idea of gaining immortality by preserving the flesh. The Pharaohs might all be lost and the world no poorer but if the seed of the alfalfa plant was destroyed how great would be the loss! The best things in life are the everyday things that belong not to the kings but to the common people.

### Horticulture in Early Days.

Persia was the first home of advanced agriculture. From her came the alfalfa plants and also many fruits. We have improved but little on the apricots, peaches, nectarines and alfalfa of the people while we have not improved at all on the peacocks, cats and rugs. Xerxes and his Ten Thousand are said to have brought the first alfalfa into Greece where it grew perfectly and was of value as a fodder plant. Rome conquered Greece and bore away with the many captives and ancient sculpture the seeds of the alfalfa plant. Rome conquered the known world and carried alfalfa as food for the war horses. The immortal Ceasar wrapped up in his war raids carried the seeds of peace and prosperity in the alfalfa plant to conquered countries. Ceasar passed on but alfalfa lived in Spain to be carried by the adventurers of Spain into South and Central America, into Mexico and later into California. I like to think of the Spanish soldiers bringing a few alfalfa seeds and planting a tiny plot for company in far away California when they were homesick for the everyday life of old Spain. Human heart aches and human joys are wrapped closely around the stories of these common things. The tiny alfalfa plant may well have been on earth and been blessed when the Creator of all things looked over the green fresh earth and pronounced it "Good."

### Regional Plants.

Plants change or acquire new habits in different lands and climates. Alfalfa has not been a successful growth in soil that lacks in lime nor is it very successful in cool moist countries. It grows best in dryer climates and requires considerable heat to reach its best growth. Plants like people when they travel become cultured and acquire adaptility to accept changes readily. Once the greatness of the alfalfa plant was recognized the great agricultural nations, of which the United States is one, have taken up the search for new regional varieties. One man has spent many years in Russia alone looking for frost resisting varieties. The common alfalfa of California came to us from Chile by the way of Spain, South America, Mexico, into Southern California. This is the common alfalfa of our field today. It is capable of great improvement as it has been allowed to grow less productive by not selecting the best plants as seed bearers.

### Arabian Alfalfa.

This plant is now only procurable in small lots. There were about five tons of seeds offered in the markets and this is far to little to make much showing in this season's planting. There are several varieties of Arabian offered by the Experimental Station in small packages under different numbers. I planted several of these small packages last spring but owing to unfavorable conditions of the season was not very successful in securing a good stand. The Arabian alfalfa will grow at a lower temperature than other varieties and produces one more cutting a year. It has a dense leafy growth and a heavy but tender succulent stem. With the great advantage of nearly twice as great a growth in the winter as the Chilean and a half more than the Turkestan, it has the disadvantage of having a much shorter life term, two, three to five years being about its duration in the land. This may prove an advantage in bringing alfal-

IT DOES THE WORK

H.H. MOORE & SONS, MFG'RS. AND PROPRIETORS STOCKTON CALIF.

fa in as a profitable cover crop in young orchards. The principal objection to the use of alfalfa in orchards has been the labor and difficulty of getting rid of it when it became necessary to plow it under. The deep plowing cut the roots of the young trees badly. It would also make it easier to use alfalfa as a rotation crop if it was not so lasting in its growth.

**Turkestan Alfalfa.**

This is coarser and more woody in its growth than the Chilean type. It will grow and produce a good heavy crop on a minimum of water and also stands cold better than the other forms. The Arabian will not stand the same amount of cold back in Colorado that the Chilean bears easily. The crop of the Turkestan is heavier than the older form. These new alfalfas have the advantage of seed selections—as a Government man would not get the seed from a run out field but would select the best plot possible. The great good

Prize Cups Won in Butter Contest During the Past Year.

then from the Turkestan alfalfa is to be found in its drought resisting qualities. It will give a profit on less water than the common Chilean forms.

The common or Chilean alfalfa seed will naturally be sown largely this season as the seeds of the newer varieties are still scarce though there was a fairly liberal supply of Turkestan seed to be had earlier in the season. I believe these two new varieties are valuable but I also know that the yield of the common alfalfa can be greatly increased by using care and judgment in handling it rightly.—M. E. Sherman.

## EDUCATIONAL BUTTER SCORING CONTEST.

A considerable improvement was noted in the quality of the butter in this contest over that of the previous entry. Of the nineteen entries, all but one were made with a starter and in four instances the cream was pasteurized. This is a remarkable change from the first entries where so few were made from cream ripened with a starter. All of the butter in this entry was made from gathered cream, except in four instances; in two of them, however, the amount of milk used was too small to mention. The method blanks show that more and more care is being exercised in preparing and using starter, and in the temperatures used for churning. Still, some of the makers are careless about filling out their method blanks. It is impossible to make useful criticisms without a record of the way the butter was made. In the long run it will pay to have a good starter can, rather than try to get along with a makeshift.

The scores were as follows:

| | Score |
|---|---|
| Pioneer Creamery, Ferndale | 96 |
| Castroville Creamery, Castroville | 95½ |
| Golden Creamery, Etna Mills | 95 |
| Meridian Creamery, Meridian | 94¾ |
| San Pasqual Cream., Escondido | 94½ |
| Suisun Creamery, Suisun | 94½ |
| Univ. Farm Cry., (Not comptg. | 94 |
| Fresno Cream Company, Fresno | 93½ |
| Ceres Creamery, Ceres | 93½ |
| United Creameries, Arcata | 93½ |
| Salinas Creamery, Salinas | 93 |
| Rose City Cream., Chico | 92½ |
| Hicks Valley Cream., Hicks Val. | 92 |
| Crystal Cream & Butter Co., Sacramento | 91 |
| Laton Co-operative Cry, Laton | 90½ |

The next year's contest begins in January, 1910, and a large number of buttermakers will probably compete for the prizes offered.

The prize cups for the year's contest just closed were awarded to:

| | Ave. Score. |
|---|---|
| 1st. H. Ostergard, Etna Mills | 94.5 |
| 2nd, J. D. Bailey, Gridley | 93.88 |

**Certificate of Merit.**

| | |
|---|---|
| H. Ostergard, Etna Mills | 94.5 |
| J. D. Bailey, Gridley | 93.88 |
| V. F. Will, Escondido | 93.29 |
| V. Baciarini, Suisun | 92.58 |
| A. L. Bailey, Chico | 92.16 |
| J. C. Bentley, Sacramento | 92. |

The prize cups went to those having the highest and second highest average score for the six contests during the year. The Certificates of Merit were awarded to those having an average score of at least 92 for the six contests.

## POINTERS FOR MILKERS.

Cows should be milked in a comfortable, clean, thoroughly drained and well-lighted place.

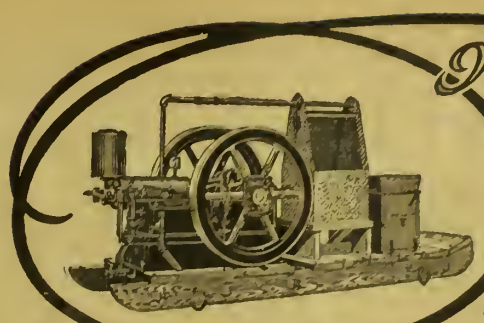
Every time you abuse and frighten a cow, you throw her milk and butter machinery out of gear.

The value of a cow should be fixed by the amount of fat there is in her milk, and what it costs to produce it.

The udder should be carefully cleaned before commencing to milk and the last drop of milk should be drawn from the udder.

Heavy milkers are often rough boned cows with large frames, but joints and ill shapes are not essential in the make-up of a good cow.

To allow a certain quantity of food to each cow in the herd alike may result in an insufficient quantity for some and too much food for others.



I H C Gasoline Engines and Pump Irrigation

IRRIGATION by pumping is making hundreds of farmers prosperous. It is the modern way. It makes you master of the water situation. You can use water when and where and as long as you like. You do not have to wait on the neighbors, or agree with them as to when the water shall be turned into your lateral.

In many cases, pumping is the only means of irrigating—you cannot get water upon your land any other way.

The simple, strong, efficient I H C gasoline engines are

**Turning Waste Lands Into High-Priced Farms**

There are hundreds of places where land can be had for a few dollars an acre. The moment you put this land under irrigation it jumps in value to one, two or three hundred dollars an acre.

There is no mystery and no impossibility about it. It is simply applying water to the land by means of an economical power that old-time irrigators did not have the advantage of. You can always find water in lakes, sloughs, springs, streams—in the underflow, in seepage, etc. Your I H C engine will pump it just where you want it.

The engines require but little attention. They pump water in large quantities and they do it economically. They are not adapted to pumping water only. You will have a score or more uses for them on your farm—operating your grinder, fanning mill, cream separator, churn, pump, thresher; your bean huller, cider press, alfalfa cutter, and any other machines requiring power.

The I H C line includes an engine for every section and every problem—all sizes for all farm uses; vertical, horizontal—both stationary and portable; engines on skids; sawing, pumping and spraying outfits. Also I H C gasoline tractors—first-prize-gold-medal winners—the best all'-round farm tractors.

Look into this matter of pump irrigation. It may mean the reclamation of your land and a fortune for you. An International agent in your town will supply catalogues and particulars, or address any of the following houses for further information:

# The Tulare County Citrus Fair at Dinuba

By R. M. Teague

FOR the past six or seven years it has been my pleasure to make periodical trips through the Central Citrus Belt of California; (which finds its highest development in Tulare county) for the past three years have also heen an admiring visitor to the annual citrus fair, which has become an estahlished institution of that region. I recite these facts to give emphasis to the surprising development in citrus culture that I have heen a witness to. Every visit only confirms my first convictions, viz., that the time is not many years in the future when the output of the kingly orange and the queenly lemon in the San Joaquin valley will run the Southern belt an interesting race. New plantings are constantly going on, as is witnessed by the fact that nearly one-half of the citrus nursery stock being marketed this season finds an outlet in this valley.

The Citrus Fair was held this year at Dinuba, in the northern section of the county close in to the Fresno county line. Here citrus culture has not attained the importance that it has in the older settlements of Exeter, Lindsay and Porterville. But it is winning its spurs even further north. The fine showing of fruit from Reedley and Mt. Campbell gave strong evidence of that fact. While in Dinuha I visited a young grove of ahout 80 acres owned hy F. H. Wilson, situated at the base of the foothills some seven miles northeast of the town. The trees showed no evidence of frosts, were well developed, and gave every promise of "making good." There are scattered orchards throughout this region and also in Fresno county, all of which go to prove that citrus fruit culture will cover a wider geographical area in this state than was deemed possihle only a few years ago.

It has been said that an orange tree will stand more neglect than most any other fruit, which is true. As I become more thoroughly familiar with its environment and condition in various portions of the state, I am surprised to learn of its adaptahility to varying conditions of soil. In Tulare county we have the clay soils, both black and red; the dry hog soils; the adobe and alluvial bottom soils, all of which seem to suit the orange and the lemon. In texture these vary greatly; in and ahout Reedley and Mt. Campbell it is a chocolate color, and is known locally by that name; further south it seems to veer toward a reddish and hlack color. In the south we "hank" on the decomposed granite soils, the sandy and gravelly soils, the red mesa lands and tne sandy loams. But your orange seems to thrive equally well in hoth sections. So it is not wholly soil, but water, care, climate and soil combined that makes the premium fruit.

But to return to our "Mutton" and the Cltrus Fair proper. In arrangement it much resembled the Citrus Fairs of the south of twenty years ago. The Dinuha people showed enterprise and "go" in erecting a temporary huilding of large dimensions in which to pull off the event. The report of the judges more fully covers the character and quality of the fruit displayed, which is as follows:

Dinuba, Calif., Decemher 4, 1909.

To the Officers and Directors of the Tulare County Citrus Fair Association:

Gentlemen:—

We your Judges of the Citrus Fruits at your first Citrus Fair in this city desire first to commend the fine display you have gathered, not only as to the quality shown and the striking manner in which it was exhihited; but also as to its superb quality. Naturally enough, here and there a specimen suffered from the fact that it was not wholly matured nor fully ripe. Something might he said as to the fact that in some cases the specimens suhmitted for competition were faulty in shape, showing damaged peel, and other hlemishes, all of which militated against it as premium-winning fruit. These little drawbacks call attention to the importance in careful selection of specimens when the same is to compete against the field.

To the beginner in citrus culture the mere outward appearance of the fruit often is the only test hy which comparative judging is done; hut in its last analysis the real test is its eating quality. In this connection it may be of interest to give in hrief the system wherehy the survival of the fittest is arrived at in the judging of oranges and lemons. To do this we establish a scale, the perfect specimens representing 100 points—divided as follows:

For oranges we have 10 points for size; 5 for form; 10 for color of peel and flesh; 10 for weight; 10 for peel; 6 for fiher; 6 for grain; 4 for seeds; 30 for taste. For the lemon a similar scale is used varying of course, in the several divisions. By this system the single entries were carefully gone over, each fruit was cut in halves and carefully tested out, the result being as follows:

WASHINGTON NAVEL ORANGES.

E. A. Miller, Globe, First.
A. G. Schulz, Porterville, Second.
T. R. Evans, Exeter, Third.
H. C. Carr, Porterville, Fourth.
V. D. Knupp, Porterville, Fifth.

LEMONS.

Mrs. F. W. Mixter, Exeter, First.
Wm. Harmon, Porterville, Second.
Mr. Tout, Lindsay, Thlrd.

LIMES.

W. R. Wood, Exeter, First.

THOMSON'S IMPROVED NAVEL.

Mr. Graham, Lindsay, First.
C. A. Hotchkiss, Exeter, Second.

MEDITTERRANEAN SWEETS.

C. J. Carle, Lindsay, First.

A PRINCELY CITRUS GROVE AND HOME IN CENTRAL CALIFORNIA.

POMELO.

W. O. Randolph, Exeter, First.
W. R. Wood, Exeter, Second.
J. M. McCormick, Orosi, Third.

SEEDLING ORANGES.

Walter Madden, Orosi, First.

TANGERINES.

Capt. Hutchinson, Lindsay, First.

On the best display of Citrus Fruits made hy an individual grower, H. C. Carr of Porterville, First; Martin and Dudley, Orange Heights, Second.

In making the awards for locality display your Judges based their conclusions on a scale of 100 points as follows: Fifty points for quality and quantity of fruit; 25 on plants and greenery decorations; 15 on bunting and electrical effects, and 10 on design.

On this hasis the awards resulted as follows:

Exeter, First; Lindsay, Second; Porterville, Third; Orosi, Fourth; (Highly commended for its magnificent diversified exhihit of soil products), and Visalia Fifth (commended.) We understand that the latter two were not entered in the competitive classes, nevertheless, on grounds of quality, originality of display, we recommend that you give these two exhibits recognition.

Special commendation is also due the excellent locality exhihits of Reedley, Mount Camphell and Orange Heights.

In fruits other than citrus the few awards were as follows: Best display of olives, W. A. Bates, Dinuha, First; T. Jacob, Visalia, Second. Best display of grapes, W. A. Bates, Dinuba, First; Henry Snodgrass, Exeter, Second; L. A. Camphell, Monson, Third.

Among the minor exhibits the showing of mountain apples, embracing some four varieties, was exceptionally fine, the fruit heing well colored, good size, solid, and of a sprightly acidulous flavor; on the ground of quality, it certainly merits warm commendation.

The Calwa Distrihuting Company's showing of unfermented grape juice, elegantly hottled, was also a noticeahle feature which can be highly commended.

The collection of ornamental house plants consistlng of ferns, palms, begonias, and a line of cut flowers evinced the right spirit on the part of the ladies of Dinuha.

Mention must also be made of the superh showing of orchard and vineyard products made into jams, jellies, marmalades, etc.; all of which evinces a due respect for the science of domestic economy on the part of the good housewife.

In conclusion, we desire to commend the superh display of fresh, canned and dried fruit, olive oil and pickle olives, garden and field crops, exhihited by the enterprising growers of the Dinuha district, and especially the excellent displays of Emperor grapes,—among the finest it has heen our pleasure to see. This exhibit includes the superh showing of dried fruit and raisins, and canned fruits in glasses and tin made hy the Griffin-Skelley Company. Another feature of like nature was the exhihition made hy the California Dried Fruit Agency, which attracted much attention.

All of which is respectfully suhmitted.

R. M. TEAGUE,
C. D. HUBBARD,
H. W. GRUCKERBERG,
Judges.

If coming events cast their shadows before, the next fair will be appropriately held at Visalia. To be sure it is not situated in the orange section of the county, but it is its largest and oldest town, full of the early activities of the Central San Joaquin valley, and typical of the state's material development and civilization. For these reasons alone it is a happy selection, and I predict "big things" for the industry when the Fair of 1910 shall become a tangible fact at that point.

# Deciduous Fruit Culture

## THE ALMOND COMMERCIALLY CONSIDERED.

By J. P. Dargitz, Acampo, Cal.

Read before the State Fruit Growers' Convention at Watsonville, December 8th, 1909.

"Take of the best fruits in the land: balm, spices, myrrh and almonds."
Gen., 43:11.

"Moreover the word of the Lord came unto me, saying, Jeremiah, what seest thou? And I said, I see a rod of an almond tree. Then said the Lord unto me, Thou hast well seen,"
Jer. 1:11.

THE ALMOND is by no means a new nut, and perhaps justifies the old saying "there is nothing new under the sun." More than four thousand years ago Jacob made use of it in his efforts to achieve commercial success, though in a different way from that which we have in mind today. Later in his life the same Jacob, chastened by his experiences, classed the almond as among the choicest fruits in the land. We are not told whether it was a hard-shell or a papershell, a Nonpareil or a Texas Prolific.

It was from an almond tree that Moses cut the rod which became a serpent when he cast it down. May we get a lesson from this to the effect that we should not look with indifference on this nut-bearing tree whose beautiful blossoms furnished the Divine pattern for the bowls of the candlestick in the Jewish Tabernacle? The prophet Jeremiah was also commended by the Lord of Heaven and Earth for seeing a rod of an almond tree.

The bringing of almond trees from Europe to California as early as 1853 had about as much religious significance as anything else brought here in that early day. It was discovered that even "Sunny California" would not produce almonds in every nook and corner. This, like most of our horticultural successes, came about by lessons of bitter experience, whenever we have proceeded without due consideration. However, we have learned, little by little, until the almond crop of this state now aggregates over half a million dollars annually, and there is no good reason in the world why it should not equal three million dollars, as the people of the United States consumes that quantity now. That the consumption of this excellent nut is increasing in the United States is shown by the fact that while in 1907 the consumption was 7900 tons, in 1908 it was 11,200 tons, a clear gain of over 40 per cent. in one year. When it is understood that over 75 per cent. of this consumption is imported from Europe, and that the area for the home production of this nut is practically limited to California and a very small portion of the state at that, we will hardly need to think of overproduction for a lifetime at least. In fact I doubt if we will ever be able to keep up with the growing consumption. Therefore, in view of the viticultural situation and the great influx of population and development of our resources, is it not worth while to look seriously into the commercial possibilities of the almond?

The almond is such an early bloomer, such a shy bearer in some varieties and locations, and such a "sensitive plant" with regard to bearing, that I would emphatically advise all who anticipate starting in almond production to gain all possible information from the experiences of the past and especially as to the behavior of the various varieties in the locality which you have under consideration. If there has been no proving in such locality, then get all your information and begin slowly and prove the varieties for yourself. Of course if you plant an almond orchard and it does not prove a success your effort has not been entirely lost for you can profitably work your trees over to other varieties of fruits. You can change varieties of the almond by grafting or budding, or you can work plums and prunes on them very profitably. The writer's brand of sugar and giant prunes, which has won high standing among the trade in the East, has been achieved with fruit grown on almond trees worked over to prunes after they were fifteen years old. In this connection I would especially advise the reading of E. J. Wickson's book, "California Fruits and How to Grow them." In this you will find very much that is helpful in getting your starting points.

### Climate.

In the matter of climate you must consider both frosts and a tendency to continued wet weather at blooming time. I am satisfied that crops are as often lost by wet weather during blooming time as by frost. It takes sunny weather in blooming time to ripen pollen. Note the odor of honey and perfume in the orchard when the trees are in bloom, if it is sunny, as against the lack of such evidence on a cloudy or rainy day. Moderate frosts in winter while trees are dormant, or even when they begin blooming, do not always presage damage. But there should be no late spring frosts. Bear in mind that the almond is the earliest bloomer of all our fruits.

### Location.

A sheltered location where there is a ravine, or some lower ground close by, which may draw off the cold air after night, in a usually frostless situation should be ideal. The crop does well even in low altitudes, (our orchards being only 75 feet above sea level), while there are some young orchards on Paradise Ridge in Butte county on an elevation of 1700 feet which are doing well. They have a deep ravine on either side of the Ridge which draws off the cold air so that ripe strawberries may be picked from the field at Christmas time.

Portions of Butte, Colusa, Lake, Yolo, Solano, San Joaquin, Contra Costa and Sutter counties have been proven for almond growing.

### Soils.

The almond likes a deep, rich, sandy loam soil. It should be deep and well drained because this tree will not endure wet feet much better than the peach. The soil should be rich for the tree is a ravenous feeder. It must have plenty of soil moisture as it is the earliest to begin work in the spring and the last to take its annual vacation in the autumn; and to make good strong fruit buds for the succeeding year the

tree should hold its leaves well into November. It cannot do this without good moisture conditions continuously throughout the season.

**Varieties.**

Perhaps there is no point in the whole proceeding wherein greater care is necessary than in the proper selection of varieties. Everything else may be very good but if you have the wrong variety you will likely wait in vain for your commercial success. It is utterly impossible to give the one best variety for all sections, because it is not at all likely that any one variety will do equally well in all localities. If you are greatly in doubt get some budding sticks of the variety you are considering and bud them on one of the proper trees in your neighborhood. In two years, certainly in three years, you will have the beginning of your proof. However, no one should emphasize the qualities of any nut or fruit by one or two years proving. It should require ten or a dozen years proving before speaking out with authority. If this plan were generally followed we should not have so many disappointed orchardists. Usually when a man finds a new fruit which has extraordinary quality he forthwith begins to herald it and people begin to plant, yet it might be such a shy bearer or poor keeper as to prove a commercial failure, no matter how excellent the fruit might be.

The original almond was no doubt a hardshell. In fact we know of nothing like the papershell nut until in recent years, and I doubt if one in five of the population of the United States even now have ever seen a papershell almond. Whenever any animal or vegetable product is bred very highly for quality, it is apt to be lacking in quantity when it comes to reproduction or propagation. So with the almond. The papershell is largely deficient in pollen. So sure am I of this that I would not think of planting a block with all papershells no matter how much the varieties might be mixed. It has been customary to plant an occasional seedling or bitter almond in the orchard so as to furnish the necessary pollen; but we now have varieties of the sweet softshell which answer the requirement and are profitable.

My first and great reliance is on the Texas Prolific. I am planting it solid and am also alternating it with other varieties, for the benefit of the other varieties, however. It blooms later by two weeks than any other variety that I know of, tree grows well and bears every year. Trees now 20 years old have borne 17 consecutive crops. I would also plant Nonpareil and Drake's Seedling, alternating either variety with Texas Prolific every two rows. It is easier harvesting if two rows of a kind are planted together. The Nonpareil ripens early and can be gathered before the other varieties are ready. Then comes the Drake's Seedling about three weeks later. The Texas Prolific comes along about two weeks later than the Drakes, all of which is a great advantage if you have a large acreage. These are the three proven successful commercial varieties in our locality. Whether they will do so in your locality I can't say, but on general principles they should, and are worthy a trial. In Yolo county the Peerless is a great favorite. In some localities the I.X.L. is said to be a good bearer. If so it is a good nut to plant there, because it is a good nut and will not meet with much competition from other localities.

**Planting.**

Secure the best trees you can get. It is poor policy to plant an inferior tree because it is cheap. There is great opportunity for some one to become a benefactor of mankind by developing superior strains of the best varieties of nuts as well as other kinds of fruits. It is a fact that there are some trees in every orchard no matter what the parentage, which grow better and bear better than others growing by their side and of the same parentage. I am sure that this will be found to be true in fruit trees as it is in the animal kingdom, yet how utterly indifferent we have all been on this great point which means so much on the commercial side of our work! In good soils where the growth of the tree will be vigorous 25 x 25 feet is plenty close to plant. When the trees are twenty years old their branches will touch and they will need room for twenty or thirty years more.

**Pruning.**

The first three years you will need to shape your tree. After that you will only need to remove water sprouts and an occasional cross limb, until your trees get very large, when you will need to cut out some of the big wood and open up the trees. Mr. Adams my neighbor, says "Prune so a bird can fly through the tree," and he is about right. The tree requires much less pruning than a peach tree. With the peach tree we prune to lessen the pieces of fruit but with the almond tree we want to increase the pieces in number. I never knew of any one having to thin a crop of almonds although in 1908 we did have some limbs as large as my arm break with their load of fruit.

**Spraying.**

You will need to spray your almond trees sooner or later. You may have to fight the fungous growths. If so then you will find a friend in some form of lime, sulphur or bluestone. You may have to fight red spider; then sulphur is a good remedy. It may be you will have to fight the peach moth larvae; then some form of the arsenicals. In the writer's judgment you can just as well use your materials dry as wet. I have used the dry or dust spray exclusively for three years and am quite well satisfied with results. The great difference is on the commercial side of the expense account. The method we use is as follows: In December we spray with lime, sulphur and powdered bluestone, (Sal Bordeaux). We use 40 pounds of lime, 5 pounds of sulphur, and 2 pounds of Sal Bordeaux. This makes a very good treatment for two acres. When the trees are in full bloom we spray again with the same mixture and add to it 2 pounds of Paris Green or 2 pounds of Arsenite of Lime. If there is evidence of the peach moth larvae at work in the buds later, we spray again the last of May so as to catch the second brood, using the same formula as in the previous spraying, though the Sal Bordeaux may be cut down one-half or omitted entirely if there is no evidence of fungus about the trees. If red spider makes its appearance, then a treatment of the sulphur alone will settle Mr. Spider and turn the foliage from yellow to green in three days time if you do not wait too long before spraying. In applying this dust spray we use a power machine which is quite inexpensive, mounted on a wagon and driven by a two horse power engine, the whole outfit weighing only about 1000 pounds drawn by two horses and operated by two men who

Pruning in the peach orchards is being pushed as rapidly as possible so as to make way for spraying for blight.

readily treat forty acres per day. The amount of material seems small to be effective, but being applied as a mixture instead of a chemical solution, as in the wet spray, it is every bit active. The principal thing, however, is to spray if needed and if you don't want to use your application dry, use it wet, but be sure and use it.

### Cultivation.

None of our orchard trees yield quicker or more decisively to good cultivation than the almond and the principle involved seems to be to maintain a sufficient degree of moisture. We are trying an experiment on a block of fifty acres of old almond trees, having seeded it to alfalfa last April. We shall water this as often as necessary but cut no hay, allowing it to grow and fall on the ground as a mulch. If the trees do not bear with this treatment I will have added to the soil anyway. When our orchard trees get to be over fifteen years old they will require irrigation where they got along very well before with good cultivation. Of couse I am speaking of conditions in our locality where the soil is deep and retentive of moisture under good cultivation but without any subirrigation or summer rains.

### Harvesting.

Presuming that we have secured a crop and that it is time to gather it, we now come to the matter of harvesting which is no small item in a comercial proposition. I am told that about fifteen years ago a company in our neighborhood who had about one hundred tons of a crop to harvest and having no machinery, advertised in the San Francisco papers for 500 hands to help harvest their crop. About three hundred came a week ahead of time and then it became necessary to bring out a squad of policemen from the city. We would not think of requiring over fifty people to handle such a crop now.

When the hulls on the nuts are loose from the shell, as will be indicated by their bursting open, it is time to begin gathering if you wish to hull them. If they get too dry you will have to wet them before hulling or you will break the shells. If you wish to shell them then the drier the better. It will not pay to begin until the nuts about the crotches of the trees are ready and they will be the last to ripen. That is it will not pay to go over the ground twice. When they are all ready you can get all at one gathering. Have some sheets made of heavy unbleached sheeting or light duck or sail cloth. Mine for large trees are 15 x 30 feet. Two men to a sheet and two sheets to a tree. Spread the sheets under the tree one on each side, lapping the edges where they join. Then the men take willow or bamboo poles and by jarring the limbs cause the nuts to fall on the sheets. Always strike the limb sideways for if you strike a glancing blow down the limb you will bring you chances of next year's crop with you. The object is to get the nuts and disturb the foliage as little as possible. Of course you will get some twigs and leaves with the nuts anyway. When the nuts are all off the tree, the men toss their poles to the next tree and then gather up the sheets and, lifting them, carry them to the next tree where the process is repeated. That is what they should do, but if you are not watching they will drag the sheets. If the time saved is worth more than the extra wear and tear on the sheets, then by all means drag them. When enough nuts are in the sheets to fill several lug boxes, the boxes are placed on the ground side by side and the sheets are emptied of their burden. These boxes are then stacked up so as to be easily seen and the teamster gathers them up and hauls them in to the shed where they are run through the huller and then placed in the hoppers ready for the hand sorting. After sorting they are placed on trays or board platforms in the dry-yard to cure. They should be cured until the kernel will break without bending. Then they are ready for bleaching; but be sure they are thoroughly cured before bleaching or the kernel will absorb the sulphur and be spoiled. When properly cured, any means may be employed which will thoroughly dampen the shell but not penetrate to the kernel and then be subjected to the fumes of burning sulphur for a period of thirty minutes to one or two hours according to the variety and condition of the nut. A yellowish white color of the shell is demanded by the trade. Do not over sulphur. When sufficiently bleached they are removed and placed in the sun for a few hours to dry and then sacked up ready for market. My present plan of bleaching is as follows: When cured we place them on fruit trays about one inch thick and run them into a bin of the sulphur house which has been connected with a steam boiler, and then low pressure steam is turned into the house for a half or three-quarters of an hour. Then they are removed and quickly run in another bin which has a sulphur charge ready fired, and bleached from forty minutes to an hour when they are removed and immediately sacked. The same help will bleach twice as many in a day with steam as without it. Be careful not to use high pressure steam or you will cook the nuts. For this valuable method I am indebted to Mr. Reed of Suisun. Only standard almond sacks should be used, and while they seem expensive they are a commercial success because they weigh two and a half pounds and no tare is taken by the trade if you use these sacks.

The almonds may also be shelled instead of hulled as there are machines for shelling which do very good work. The present year our crop was light and we shelled our entire crop of about twelve tons of clean kernels. We figured better prices this way. Nearly all the imported nuts are shelled before importing. If you shell they are not to be bleached and you have all the shells to work back into the soil as material for humus which is no small item. For a commercial proposition if you can get the same money for your product shelled, saving thereby half the hauling and return half the tonnage to your soil which you would ship off if the product were hulled, better do it.

### Marketing.

And now we come to the keystone of the whole matter. We may get lots of pleasure and satisfaction out of our orchards in producing a beautiful bloom and a splendid crop but unless we can turn this into cold hard cash it will never be considered as a commercial proposition. It must pay! We must be able to make a net profit over and above the cost of production or there will be no inducement to continue to be a producer. The last few cents per pound that the market warrants will be that net profit and you should have it. Don't forget that. There are various efforts at co-operation among growers which are more or less successful, but there is no other line in which all might be enlisted as easily as the almond growers. The reason for this is the ease with which values may be determined. Just as long as the larger part of the almonds consumed is imported it is plain that the price of the foreign product must fix the price of the home product. When we have a plentiful crop on this coast we have to ship some to the East. Therefore the price of foreign almonds laid down at New York, duty paid, less the freight from here to New York will determine the price on this coast. When crops are light here we consume all our product on the coast and then the price of foreign almonds landed at New York, plus duty and freight out here will determine the prices here. This is so fixed and definite that it should be easy to determine the market price, yet very few seem to know about it.

The present method of marketing in a hap hazard way works a hardship on the grower because he does not always get a fair price for his product, the price the market warrants. As at present operated, the speculators learn about the foreign crop late in June or early in July, determine what the maximum price on this coast will be and then endeavor to purchase from the grower just as much below that price as possible. The object is not to buy low and sell high for they usually sell on a fixed margin above cost, but the aim is to undersell their competitors when they go to the jobbing trade as this is the one method above all others which will bring them business. The system is not to their advantage, however, because they never know when a competitor may be able to buy still cheaper from some other grower and so undersell them or cause them a loss. The party who bought our almonds this year said he would just as soon pay 30 cents as 20 cents if the market was steadied so he knew just what he was doing. But when he buys on a two cent margin and some other buyer succeeds in buying from some other grower for two cents less, then the other buyer is able to depress the market to that extent in his quotations to the trade and my buyer as well as others who were inclined to deal fairly by the growers suffer a loss which ultimately falls on the growers themselves. Understand that if you sell below the market price you not only lose the net profit that should be yours but you cause a loss to all other growers and fair dealers. It is absolutely a case where no grower stands or falls alone but he necessarily carries his fellow men with him. What we want is some method of marketing that will make the market for almonds as steady and stable as the market for flour or sugar. This will work no hardship to anyone but will be universally beneficial. It is a plan that ought to

THE BUYING OF CITRUS TREES
IS A SIMPLE PROBLEM IN ECONOMICS

You cannot extract sunbeams from cucumbers nor blood from stones, nor good crops of fine oranges and lemons from inferior trees. A poor tree is an expensive experiment entailing only vexation of spirit and a dwindling pocket book. Then why experiment with stock of doubtful quality? Why not get the best and be sure of the future? For 20 years we have been supplying the people who grow good citrus fruits with their trees in every citrus growing section of the world, and stand ready to serve you equally well. Why not write us and let us become better acquainted?

The economics of successful orange and lemon growing is tersely explained in our book, entitled "The Citrus Fruits; Historically, Horticulturally and Commercially," a copy of which is yours for the sum of 25 cents.

# Citrus and Sub-Tropical Fruits

## PROTECTION FROM INJURY BY FROST.

By Alex McAdie, Professor, U. S. Weather Bureau, San Francisco.

IN our attempts to prevent damage by frost in California, the first question to be answered is, What is needed? A cheap, easily handled, effective means of preventing rapid cooling during the night and early morning hours. Also we must prevent excessive drying of the plant tissues previous to the fall in temperature and excessive warming of the dried, chilled plant after the frost. Briefly, we must shield fruit and leaf from abnormal strains, caused by rapid changes in temperature and humidity. In nearly all the papers heretofore written on Protection from Frost, much attention has been given to temperature changes; but very little has been said about the condition which so frequently precedes frost, namely, the drying. In California our frost periods are nearly always preceded by a day or two of boisterous north winds, quieting down at nightfall. These winds, we have good reason for believing, rob vegetation of much of the natural moisture, and probably leave plants in no proper condition to withstand the rapid cooling of the quiet night hours following. The plants are also in no condition to withstand the rapid warming after sunrise, when the sun's rays fall on them through a dry clear atmosphere. At such times there is nothing to intercept the sun's heat, practically no atmospheric absorption and no gradual heating, to which the plant might accommodate itself.

Our attention has been drawn to the importance of this drying effect preceding frost, by the damage done during the cold spell of December 19-20, 1908. Strong desiccating winds blew down the San Joaquin valley for several days before the freeze. My belief, expressed popularly, is that the ground was dried out, the trees in large measure over-stimulated the effort to meet the intense evaporation at the leaf surfaces. Then when the excessive metabolism could not be longer maintained there was inadequate exudation; and shrivelled plant tissue resulted; and this at a time when it was most necessary that the plant should have a good supply of water to enable it to resist rapid temperature change. Again it must be plain that such dried chilled tissue is in no condition to withstand rapid heating. There is some evidence to support these views in the well known fact that frosted oranges, for example, are somewhat dried and do not regain their natural juiciness by remaining on the trees.

If this view be correct, it is plain that in any campaign of frost fighting, we must not neglect this antecedent condition of drying and the consequent condition of rapid thawing.

The general campaign of frost fighting, as thus far laid out, covers three main lines:

1. Accurate advance information of the occurrence of frost.
2. Applying preventive measures during critical hours.
3. Preventing sudden warming of chilled fruit, or a too rapid thawing out.

Under the first of these heads great progress has been made in the past five years. Not only in California, but now throughout the various fruit sections of the United States, Weather Bureau officials recognize the value of special study of types of frost maps. The work first undertaken in California on a large scale and for a distinct purpose, is now an important feature of the forecaster's work at many places. Frosts are found to occur as a consequence of certain movements of low and high pressure areas and the displacement of the lower air incident to the pressure changes. Frost is a matter of air drainage, both on a large scale and on a small scale. In other words, frosts are successfully forecast because we understand the general movements of the lower air and in particular certain local circulations.

The forecaster anticipates a condition in which the lower air strata are quiet, dust-free, and very dry. Under such condition there is rapid radiation and loss of heat from plant and ground and a sharp fall in temperature. While the forecaster gives the general conditions favorable for frost, it must be clearly understood that each individual orchardist must study his own problem of air movement in his own locality. These local circulations should be studied in connection with the daily Weather Map. It is also advisable to have certain instrumental records, such as are given by the thermograph and hygrograph; the importance of which data will be apparent from the discussion farther on.

Under the second head, we must discuss some of the physical processes operative in the formation of frost and then mention the various devices, such as smudging outfits, coal basket, oil pots, orchard heaters, anti-frost covers, etc. Opinions will differ as to the relative efficiency of various devices and some are undoubtedly more serviceable for certain localities than others. We propose to discuss the principles rather than individual devices.

There are three general principles used in frost protection devices.

1. Adding heat.
2. Saving heat.
3. Mixing, or stirring the air to prevent cool areas.

Under the first are included all the various forms of heating devices, such as open fires, smudge fires, coal baskets, oil pots, orchard heaters, etc. The use of fires probably dates back beyond our memory, but the first use of the coal baskets for the specific purpose of preventing loss by frost was by Edward Copely at Riverside, California, about 1896. The first use of oil, that we have a record of, was by Everett ,at Arlington, Cal., and the first use of hot water was by Meacham, at Riverside. A severe frost about the end of December, 1905, caused great damage to the orange crop in the Riverside section, and the following year may be said to have marked the beginning of the frost fighting campaign. The Riverside Horticultural Club took an active interest in the problem and many experiments were conducted by such men as those already mentioned and Koethen, Reed, Holmes, Hall, and others whose names I cannot now recall, also Hammond and McAdie. The work has gone on and there are now on the market many forms of heating devices. A convenient and serviceable frost alarm thermometer and oil pot were devised by the Weather Bureau official at Fresno, Mr. J. P. Bolton, for use in the vineyards, during the spring frosts. There have recently been put upon the market orchard heaters, burning oil, and the claim is made that in the apple sections of Colorado and other Rocky Mountain states results have been most satisfactory. These are known as the Troutman Orchard Heaters, burning oil, and used variously forty to a hundred (or even more) to the acre.

Direct heating by large open fires is not recommended, as experience has shown that the heat is radiated largely upward and is not effective in warming the fruit. I may illustrate this by the following experience of one of the most intelligent horticulturists in California. Mr. J. S. Douglass of San Emigdio Ranch writes that during the night of Dec. 20th and 21st, 1908, the temperature for fourteen hours ranged between 19 and 24 degrees F. For thirty-six hours the temperature did not rise above 28 degrees F. About fifteen cords of wood and forty tons of wet hay were burned in the effort to protect the orchard. The relative humidity was low, there was little air movement and the smoke rose as straight as a pine tree. At the intersection of two roads in the orchard there was a large fire and thirty feet away a thermometer was placed in

an olive tree. A second fire was burning twenty feet away from this tree in another direction, and a third fire twenty-five feet away in still another direction. The temperature at the tree however remained at about 20 degrees F. from 3 to 8 a.m. December 21st. This was the coldest weather in this locality since 1888. It is evident that in this case a large amount of heat was lost.

Many small fires are much more effective than a few large fires. In the use of numerous small heating devices, it is possible to distribute the heat where it is most needed. It is also possible by increasing the number of wire baskets, oil pots or orchard heaters, to offset a continuing fall in temperature. It should, however, be stated that with most oil pots, unless the combustion is excellent there is a deposit of soot which may settle on the fruit.

Under the second head, that of saving heat, we have all the various smudging devices for artificial cloud making and all the different forms of covering. The object, of course, is to utilize the earth's heat as much as possible by entrapping it. Any cover spread above the ground interferes with loss by radiation and the most effective protective methods have rightly been based upon this saving and storage of heat. To be thoroughly effective, however, the cover should be spread before the earth has lost most of its heat. The cause of failure in many smudging efforts is that they are begun too late. The cover, or shield protection, has another advantage in that it serves after sunrise as a guard against the too rapid warming of the chilled plant after sunrise. We have examined many orchards in California and found that fruit was most damaged where exposed to the direct rays of the sun. While it is not definitely known what action causes the death of the cell, whether it be a rupture of the cell walls or a separation of the water and absence of the necessary turgidity, it would seem that we could not err in guarding the plant fibre from strain due to rapid and unequal heating while still chilled.

Of the various forms of cover devices, the lattice work is probably the most expensive, but certainly the most effective.

A new form of cover, known as an anti-frost cover, was devised last year by McAdie in the San Francisco Weather Bureau office. It is, however. better suited for the protection of small fruit, garden flowers and vegetables. It is based on the old and widely known practice of covering garden flowers with newspapers when frost is expected. In the new anti-frost cover there is used instead of a single cover a double layer of prepared paper with an intervening air space. This prevents almost perfectly the escape of the long heat waves from the ground. Such covering can be spread above the plant an hour or two before sunset; i. e., before the ground has lost much of its heat. If at the same time shallow pans of warm water are placed under the cover, an effective screen and serviceable supply of water are provided. It is also to be noted that we use this cover at a time when the roots are absorbing vigorously and transpiration by the leaves is at a maximum. We therefore prevent any lowering of temperature at the leaf surface and store up in the plant a quantity of heat energy for expenditure slowly through the night hours. The actual temperature of the air is of less importance than the temperature of the leaf or fruit surface. A deposit of moisture is advantageous.

A special use of the anti-frost cover in connection with tree fruits is to unroll the covers in the orchard before sunset and to roll them up about 4 o'clock in the morning.

Under the third head, methods based upon mixing or stirring the air, no special devices that are available and practicable are known. When nature mixes the air, i. e., on windy nights, frost does not occur. It is now known to meteorologists that layers of air of different temperature may lie close to one another without mixing. On nearly every frosty night there is a difference of 6, 8 or 10 degrees in temperature between the ground and the air ten feet above, the warmer layers being above. Where air is well mixed and there is good ventilation, we seldom find frost.

Finally, in our opinion the ideal frost protection method will be a combination of a cover, a heater and a ventilator, and if the views advanced at the beginning of this paper are correct, as to injury caused by desiccation, it will also be necessary to provide for water in proper quantity.

To sum up, the fruit grower should:

1. Watch the weather forecast closely.
2. Study local air circulation.
3. Use a thermograph in the orchard and study the temperature record.
4. Experiment and determine for his particular crop the most suitable heater, cover or watering device.
5. Not give up the fight against frost, because of a first failure.

### RHUBARB ASSOCIATION.

The Southern California Rhubarb Growers' Association met in Los Angeles last week and organized for the second year's work of the association. Mr. W. J. Embree of El Monte is the Secretary for the coming year. It was decided by the board of directors to open a stall in the Los Angeles Market to handle so far as possible the local sales of its members. This action has been made necessary by the treatment accorded the rhubarb growers during the last year, and they feel that they can meet the requirements of the trade better by selling their own stuff. We trust that the movement will lead to a more satisfactory disposal of the product and that it will prove a step in advancement of an industry which promises to be a great one for the state.

**Smyrna Park Nurseries**

**Campin & Moffet, Prop's.**

**Rex Lime and Sulphur Solution**

**The Famous Insecticide and Fungicide**

It has been found that Rex Lime & Sulphur Solution used in the early part of the season is as effective for Blight as the Bordeaux Mixture, and it does not have the injurious effect upon the tree as Blue-Stone. In Oregon and Washington the use of Bordeaux is being entirely eliminated and lime and sulphur solution used for all purposes. The leaves are falling from the trees, and especially the Peach, Almond and Apricot should be immediately sprayed for the first spraying. The second spraying should be done on all trees just before the buds open in the Spring.

Rex Lime & Sulphur Solution is a guaranteed article; properly prepared; free from sediment, and as cheap, if not cheaper, than the farmer can make a mixture himself.

### CULTURE OF THE GOOSEBERRY.

LATE fall, according to an expert gooseberry raiser, is the best time to set out the plant, "They start growth," he said, "very early in the spring, and when spring planting is successfully done it must be done very early. In fact, it usually needs to be done earlier than the ground is in proper shape to be worked properly. I have tried some spring planting, but not with very good results; therefore, I have decided that it is best in this latitude especially, to plant them in the fall of the year.

"In selecting a site, always select a well-drained site, and when the ground is in good condition to work, prepare it deeply and thoroughly.

"When transplanting always cut back the dry or injured roots to fresh sound wood, and avoid exposure to to sun or drying winds; cover the roots with moist, mellow, surface soil and tamp firmly.

"I set my plants five feet apart each way, so they can be worked out a little each way. Do not allow the adjoining crop to encroach upon the bushes. To insure good growth it is best to give clean, thorough cultivation from the early spring after they are planted in the fall till about midsummer.

"The fertility of the soil about the bushes may be most economically maintained by occasional applications of barnyard manure. They must have fertility if they grow and develop good marketable berries.

"Unleached wood ashes, spread evenly over the ground, are particularly valuable for bushes, vines and trees.

"In the early spring, as soon as the leaves are full grown, look for the young currant worms on the lower leaves of the bushes. They may be easily killed by spraying with Paris green, one ounce to ten gallons of water or hellebore one ounce to three gallons of water. To be most effective this should be sprayed on from the under side of the bushes. A second breed of the worms sometimes appears abount midsummer, when a second spraying may be necessary.

"Prune every year, either in the late fall or very early spring, and here again, I have learned that late fall pruning is better than spring for the gooseberry. I now do all my planting and pruning in the late fall, after the sap has all gone down, and I have much better success with them than I did when I tried the spring planting and pruning.

"I have found that a good plan is to grow them in bush form with about six bunches to the bush. Then by adopting a renewal method of pruning the oldest bunches and allowing two strong new ones to take their places, fresh vines can be kept at all times.

"I cut out all the other new canes that come from the bottom and shorten back the two left to about two feet to cause them to branch out at the proper height.

"Should the experimenter wish to increase his stock of any of the varieties he may readily do so by layering a few of the lower canes or making cuttings about eight inches long—of the new wood pruned out—and planting them about six inches deep in moist, mellow soil."—Portland Oregonian.

### LILIUM LONGIFLORUM.

NEARLY all lilies thrive in this mild climate if their needs are understood, but none are easier to grow than L. longiflorum and its varieties. The writer has grown them in considerable quantity for many years and except for insect pests finds them very satisfactory.

The quality of the soil is of secondary importance provided it is rich enough to furnish proper nutriment without applying stable manure. Plant the bulbs four or five inches deep, and do not allow them to suffer for water. Unless the ground can be frequently stirred to prevent baking, a mulch of leaves, chopped straw, or shavings should be applied. A position in full sun away from trees is to be recommended.

Attempts have been made here to grow them commercially from seed. A description of this method may be interesting.

The seed ripens about September 1st, and is sown immediately in beds of proper soil, under the partial shade of a lath frame or of canvas. They usually germinate freely in three to six weeks. With favorable weather and good care they are ready to transplant in March to the field. An acre of ground will accommodate 40,000 to 50,000. Considerable care in watering and cultivating is necessary to prevent the small plants from becoming dormant during the summer months, as it is their nature to do. Therein lies the secret of getting a large bulb in a short time. With continuous growth they all flower freely in May and June, twenty months or thereabouts from the time of sowing the seed, and the bulbs are then ripened and are ready to dig late in August.

A few of the stronger seedlings have flowered for me in the fall, ten to fourteen months from the time the seed was sown. Several have had as many as nine flowers. These bulbs all bloom again at the regular time in the following spring.

Most of the work with seedlings has been with stock raised from crosses of the different varieties of L. Longiflorum viz.: Harrisii, giganteum, multiflorum, etc. Many of these hybrid seedlings show extreme vigor throwing stout, well clothed stems and bearing fifteen to twenty-five flowers—exceptional ones as many as thirty and forty. Among them are found all types imaginable, in size, shape and substance of flowers; in color of stem and in leafage, as well as in general vigor.

The industry is decidedly in its infancy yet and may take a number of years to prove it. We have much faith in its final success. Much work needs to be done first, however, in selecting and fixing a proper strain and this takes time.

I have had considerable trouble with an insect pest, a minute mite that attacks the root and bulbs, burrowing in the tissue of the scales and causing decay. This is scientifically known as Rhizoglyphus rhizophagus, and is found frequently in decayed portions of bulbs of other plants, but I think that in them it only follows up attacks of disease, while on lily bulbs it is decidedly the aggressor, attacking the new, healthy tissue freely and soon reaching the heart of the bulb.

Having no freezing weather here, soil once infested by these pests seems to be continuously occupied by them. Where they come from I can only guess, but think they are brought in by stable manure. Upon land where no bulbs or roots have previously been grown and where no stable manure has been applied, I have no doubt healthy bulbs can be grown, provided the seedlings have been raised in clean soil in the seed beds. I am planning to try some experiments in sterilizing the soil by soaking with various chemical solutions.—Fred Rafferty in Pacific Garden.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Scab Treatment.

Can seed potatoes be dipped in any solution that will prevent them from having scab?—C. M., Arroyo Grande.

One ounce of corrosive sublimate dissolved in six gallons of water is a very successful treatment for potato scab. Some prefer the formaldehyde solution which is made of 16 ounces of 40 per cent formaldehyde to 30 gallons of water. Immerse the whole tuber in one of these solutions, but it must be borne in mind that the seed after this treatment must be planted on clean soil, for if soil is infested with spores of scab fungus the crop will still be infested. Immerse the whole tubers in the solution an hour or more.

### Trellising Muscats.

Will muscat grapes grow on a trellis and thrive and do as well with the same treatment and soil as the Concord variety? Any suggestions for special cultivation or treatment for muscats will be appreciated.—N. E. M., Santa Ana.

The muscat grape will do well on a trellis. This means long pruning in one sense but they should be short pruned on the long canes. That is, grow your vines over the arbor and prune to short spurs on these. Don't try to cover the arbor in a year or two, for if you do, you will have long stretches of branches without any canes or buds. Extend the vine gradually, not making over two new main branches each year.

We cannot tell if it will do as well as Concord in your locality. Muscat drops its fruit badly in some situations while nearby it does not. If muscats do well when pruned short in your locality, they should do well on a trellis, only they should have more water and some fertilizer.—J. W. M.

### Sore Eyes.

I have a young sow that has lately had sore eyes. Matter forms till they are nearly closed. She seems to be in good health otherwise.—J. R. D., Turlock.

Get the following prescription filled and use two or three times daily with a curved medicine dropper. Adrenolin two drams, distilled water two ounces, mix and use with the dropper.

### Killing Elm Stumps.

What is the best way to keep suckers away from elm trees? I intend to cut them down.—J. S. K., Gilroy.

The most effective way to handle stumps to prevent suckers is to clear away the dirt from near the trunk and then pile brush around it and burn. This usually scorches the life out of the stump so that it will not sucker.

### Wonderberry.

Will you please tell something of Burbank's wonderberry through your Queries and Replies. What do you thing of its food value, and when and how is it best started?—H. M., Pasadena.

The wonderberry has been such a bone of contention that we hesitate to give any estimate of its worth. As a rule we understand that those who have grown it are very much disappointed with it, though there are some who maintain that it makes fine pies. The method of culture is practically the same as for tomatoes. Seed may be planted in hot bed or cold frame in January and plants later reset. Those who have observed the two plants claim that the garden huckleberry is vastly superior to the wonderberry and easier of cultivation.

### Keeping Olives.

Will pickled olives keep in brine without being hermetically closed, and how long?—R. W. E., Sanger.

That depends on several factors. Green olives which have been very carefully picked and handled and cured with best methods of removing the bitter principle, will keep for some months. Ripe olives are not as good keepers, though they can be kept for some time in a good strong brine if carefully pickled, but it goes without saying that they never will keep as long as when placed in cans and sealed. Just how long they will keep, no man can say. We have knowledge of shipments to Chicago of carloads or pickled olives which were supposed to be almost perfect in methods of pickling, but the entire shipments were later dumped into the lake because of softening.

### Corning Beef.

Can you give me recipe for corning beef? I find none in my cook book.—S. A. K., Imperial.

First thoroughly rub salt into the beef which has been cut into proper sizes. Pack away for twenty four hours. This draws off the blood. Take up the beef and let it drain, then pack in barrels as desired. Make a pickle prepared as follows: For each 100 pounds of beef use 7 pounds of salt and 1 ounce, each of saltpetre and cayenne pepper, 1 quart of molasses and about 8 gallons of soft water. Boil and skim well. When cold pour over the beef. If the beef has been closely packed, this amount will well cover the 100 pounds.

Another method is as follows: For each 100 pounds of beef use 5 pounds salt, ¼ ounce saltpetre, 1 pound brown sugar, dissolved in sufficient water to cover the meat. In two weeks drain off and throw away this brine and cover beef again with fresh brine made in the same way.

### Asparagus.

Should the past season's growth on asparagus be cut off now, or will the frost kill it later and then be cut away? Should it be fertilized and with what; and how deep should the roots be covered now when it was planted last winter?—R. W. Edmiston, Sanger.

I prefer to allow the tops to ripen naturally before cutting off. It greatly aids in perfecting the crowns or buds for next season's growth. The only objection to allowing the foliage to ripen before removal is the fact that many of the seeds will shell out and become equivalent to weeds the following season. But it is better for the plant to allow it to mature even if it entails some labor in destroying the young seedlings. Nothing is better than stable manure for fertilizer and you can apply it any time from now until February. Spread it even-

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

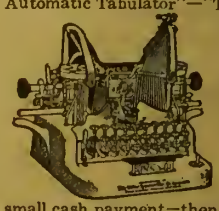
**A $100 Typewriter for 17 Cents a Day!**

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



**Yours for 17 Cents a Day!**

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

**A Quarter of a Million People are Making Money With**

The OLIVER Typewriter

**The Standard Visible Writer**

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

**"An Oliver Typewriter in Every Home!"**

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

Enjoying the balmy air of the South or the cool and bracing air of the North.

Personally conducted excursions every day from Los Angeles via all routes without change to principal eastern points.

**Southern Pacific**

ly over the entire surface and keep the patch clean by cultivation.

I do not fully understand the question about the depth the roots should be covered now. Four to six inches is deep enough for the roots to be covered at any time. The annual dressing of stable manure will keep it in good shape. Three or four inches deep with manure will not hurt and the crop will respond to such treatment. An annual dressing of Kainit—a low form of potash—about the rate of 1000 pounds per acre will be a great benefit. Apply on February.—Q. A. L.

### Himalya Berries.

Does the Himalya berry require a great deal of water or will it do fairly well without?—P. W., Ventura.

It would do as well perhaps as any other variety, but I question if any variety would give satisfactory results without plenty of water unless it should be upon exceptionally moist soil. The plantations of this variety that I have seen have had abundance of water and produced enormous crops, but the quality is not equal to Crandall's Early.—Q. A. L.

### OF INTEREST TO ONION GROWERS.

Mr. Geo. Murdock, of the California Seed Growers Co., just returned from Texas. He reports that on account of the extreme drought, only a small acreage has been planted to onions. This being so, would it not be a profitable crop for our California onion growers? Crystal Wax sets planted now will mature about April 15th. This will be early enough to get a high price while the early onions are scarce.

# Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

### AH. SWEET IS TIPPERARY.

Ah, sweet is Tipperary in the spring-
time of the year,
When the hawthorn's whiter than
the snow,
When the feather folks assemble and
the air is all a-tremble.
With their singing and their wing-
ing to and fro;
When queenly Elieve-na-mon puts her
verdant vesture on,
And smiles to hear the news the
breezes bring;
When the sun begins to glance on the
rivulets and dance—
Ah, sweet is Tipperary in the
spring!
Ah, sweet is Tipperary in the spring
time of the year.
When the mists are rising from
the lea,
When the Golden Vale is smiling
with a beauty all beguiling
And the Suir goes crooning to the
sea;
When the shadows and the showers
only multiply the flowers.
That the lavish hand of May will
fling;
When in unfrequented ways, fairy
music softly plays—
Ah, sweet is Tipperary in the
spring!

Ah, sweet is Tipperary in the spring-
time of the year.
When life like the year is young,
When the soul is just awaking like a
lily blossom breaking,
And love words linger on the ton-
gue;
When the blue of Irish skies is the
hue of Irish eyes,
And love dreams cluster and cling
Round the heart and round the brain,
half of pleasure, half of pain—
Ah, sweet is Tipperary in the
spring!

—By Dennis A. McCarthy, in Literary Digest.

### EULALIE'S TREACHERY.

IT SEEMED to me I was dying at the moment, but I knew I was grave and calm and self-possessed and gave no outward sign of the passion and pain that raged within me.

I could not understand it.

He loved me. His face was passion paler that my own and had grown almost haggard since our parting the evening before. I knew men had passed over more than this story I had told him or rather written to him and sent to him with Eulalie.

God knows I had never dreamed it would part us, but even if I had known it he still would have heard it.

He had said he loved me—had asked me to be his wife, and I had answered there was something he must know before I gave him my promise to be his wife, and then—ah, how gladly, my face, my voice must have told him I would lay my hand in his.

"But you love me and I love you, sweetheart, What could come between us?"

"Nothing, I hope," I had answered softly; and to myself I had whispered, as if for consolation: "I had no share in the sin or the sorrow," only I had no courage to tell him the story of my father's dishonor and his death.

It was such a pitiful story for a daughter to tell. The appropriation of money entrusted to his care—taken, I knew, with the almost certainity of being able to pay it before demanded, and then—then the sudden bursting of the bubble he had placed his faith in, and then—then his death by his own hand.

It was terrible, even its memory, but he, my lover, would teach me to forget it.

We stood together now with the pitiful story told, and I knew, even before he spoke, that it had parted us.

"We would never be happy, Helene," he said. "My father would never forgive me—it would break my mother's heart. It would be an ever-present shadow—an ever-present memory to them as well as to me."

"I looked at him with wide, frightened eyes. I knew it was bad enough but that love could surmount even its memory had been my dream.

"No sin is too great to be forgiven," I said, and I knew my voice had grown cold and strained. Whatever pride I had had come to the rescue of my woman's dignity.

"No," he said, slowly. "Only it is you and I, Helene—only we two."

It was afterward I wondered what he meant. Then it seemed to me as if I must fall dead at his feet.

He saw I was trembling and suddenly bent forward and clasped me in his arms, kissing my brow and lips with passionate tenderness.

'Love! Love! Why should you and I suffer for the sins of others. Helene,if you are willing, let us face it together. For you and love I will give up father and mother——"

"Not for my sake. I could not be your wife now, Leigh, for all the earth holds. Let me go," I said.

His arms loosened and I stood pale before him. He had made his choice and he must abide by it.

"Goodby," I said, and turned away without another word.

He sprang after me.

"Helene! Helene!"

I turned and looked at him. What he read in my face I can not tell. Perhaps it was scorn, perhaps only passionate pain, but he drew back then, and I went my way.

How I reached my room I can never tell; only this I know: when the dawn of the next morning broke I was still kneeling where I had sunk in my agony the evening before.

Through my memory were ringing the words of a poem I had read long years before—ringing with pitiful persistence:

"How can one live in dreams that
are dying
In wondering sorrow, day after
day?
How can one bear to always be sigh-
ing
For love and for kisses, long passed
away?"

Yes, that is all years ago—all the pitiful story I wrote in my journal, and I am paler and older and beauty-faded. Is my beauty faded? I wonder, I can not answer, for a weary heart is no beauty frightener, but I know now the shadow that lay between me and Leigh Clarke.

It was not my father's mad act in a moment of madness, for that he knew nothing of, but the story Eulalie told him—Eulalie who had been to me as a sister, as a child to my mother.

She is married now, for wealth and position, and in reward for some kindness—fighting at her bedside the shadow of death—she told me the story.

It was a story I had never heard

of—the story of a girl of 17, who had fled from her home, with a man who could not make her his wife for the good reason he had one already. The shock had killed the girl, and she was brought home dead to her father's home. The girl was Leigh Clarke's sister, and the man's name was Phillip West. "And I made Leigh believe it was your father, Helene," she said, 'though they were not even related. Do you wonder he shrank from bringing you to his father and mother in their dead daughter's place?"

"How can I murmur, when love is still living,
Though the wide ocean roll between it and me?
There's still hope of meeting; there's still joy of feeling
Whenever the aftermath cometh to be."

Yes, I am a little older, a little paler, but it was my old glad face that smiled back at me today.

I was fastening a cluster of roses on my breast, for Leigh loved roses and he was coming to me once again, my lover as in days of yore, and I was waiting to welcome him with smiles and tears, a woman's weapon and defense.

Eulalie had told him the story as well, for I think I was yet too proud to do it, and——

The doorbell rang and I pinned the flowers and took another look at my flushing face, and then——

Then I was in the parlor and the volce I loved was in my ears.

"Helene! Sweetheart!" And as he folded me close within his arms I knew the aftermath had come—the aftermath of peace and thanksgiving. —Spokesman Review.

## RECIPES.

### English Fruit Pudding.

Soak one-half of a pound of stale bread-crumbs in one cupful of scalded milk one hour. Add two-thirds of a cupful of sugar, the beaten yolks of five eggs, one cupful of raisins seeded (cut in pieces and dredged with flour) two-thirds of a cupful of currants, one half of a cupful of chopped English walnut meats, one-half of cupful of finely chopped figs, and one-half of a cupful of finely-cut citron. Chop one-half of a pound of suet and work until creamy, using the hands. Add to first mixture, and when thoroughly mixed, add one-half of a grated nutmeg, three-fourths of a teaspoonful of cinnamon, one-third of a teaspoonful of cloves, one-third of a teaspoonful of mace and one and one-half teaspoonful of salt; then add the whites of five eggs, beaten until stiff. Turn into a buttered ring mold, cover with buttered paper and steam four and one-half hours.

### Chocolate Nut-Sticks.

First mix carefully together one cupful of fine granulated sugar, one-fourth of a cupful of melted butter, one unbeaten egg, two squares unsweetened chocolate (melted), three-fourths of a teaspoonful of vanilla, one-half of a cupful of flour and one-half of a cupful of English walnut meats cut in pieces. Line a seven inch-square pan with paraffin paper and spread mixture evenly in pan. Bake in slow oven. As soon as removed from oven turn from pan, and remove paper; then cut cake in strips, using a long sharp knife. If these directions are not followed the paper will cling to cake when it will be impossible to cut it in shapely pieces.

### Candied Orange-Peel.

Carefully remove all of the peel from four thin-skinned oranges in quarters. Cover with cold water, bring gradually to the boiling-point and let simmer until soft. Drain and remove all white portion by scraping with a spoon. Cut yellow portion in thin strips, using the scissors. Boil one cupful of sugar and one-half of a cupful of water, until syrup will thread when dropped from tip of spoon. Cook strips in syrup five minutes, drain, and roll in fine granulated sugar.—Woman's Home Companion for December.

## PROGRESSIVE.

She—The doctor says I have heart failure.

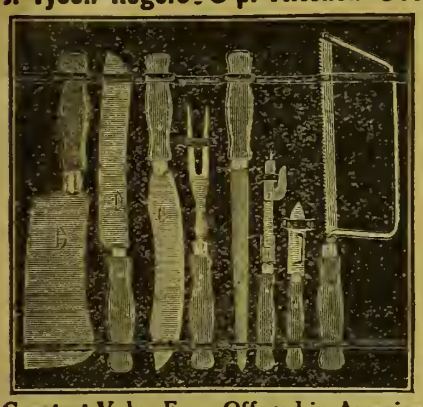
Hustling Young Lawyer—Then appoint me receiver at once.

## SQUELCHED.

Mr. Lemmin—Your family tree, Miss May—ha, ha—must be a peach.

Miss Keene—Maybe. Yours is sure a chestnut.—Cleveland Leader.

**J. Tyson Rogers 8-p. Kitchen Set**



**Greatest Value Ever Offered in America**
**Cleaver,** handy size for cutting chicken, fish and meat bones and chopping vegetables (saves hacking up your knives). **Bread Knife, Carving Set 3 p.** Scimiter and swaged blade and Steel of emery and carborundum mixed—fine for sharpening (will not break). **Universal Can Opener,** opens any can round or square. **Patent Apple and Potato Parer** (cuts a thin peeling). **Meat-Saw** for heavy bones. This set is made of selected **cutlery-steel** with Ebonized Handles, well riveted and is **guaranteed indefinitely.** We will send new goods immediately for any piece found defective. Our goods stamped plainly "J. Tyson Rogers." Look out for cheap counterfeits—not riveted. Price $2.50 (worth $5.00) in a neat box. **Leatherette Velvet-lined** Case for a wedding gift $2.50 extra. If you wish sent by mail, prepaid, add **40 cents for postage.** Send money order. Agents wanted. County rights given to capable men of clean habits.

# Malthoid Roofing

Saved the lumber, coal and building plant of A. I. Schowalter & Co., of Halstead, Kan., from fire last March. The south wind blew the flames from a barn filled with hay directly on the sheds of this company. These sheds were roofed with Malthoid, while the sides were covered with corrugated iron. The heat was so intense that it ignited the wood back of the corrugated iron and it was only with difficulty extinguished. The fire-resisting qualities of Malthoid Roofing saved the roof, which was subjected to the most heat.

Malthoid Roofing is fire-resisting and durable.

# San Francisco and Los Angeles Produce Markets

## Los Angeles Markets

LOS ANGELES, December 8, 1909.

### Butter.

Butter stands as it has for the past week. Cooking and creamery are in larger demand.

Produce Exchange wholesale quotations are as follows with actual selling prices to the trade 2½ advance on Extras.

Creamery per roll .....67½@75
Eastern Creamery per roll .....67½
Cooking .....26
Ladies .....26@27

### Cheese.

Northern fresh .....19@20
Domestic Swiss .....23
Imported Swiss .....32

### Eggs and Poultry.

No change in the local egg market. Easterns are coming in in large quantities and storage stock is weaker.

Paying price f. o. b. L. A. is:
Local candled .....51@53
Case count buying price .....48
Eastern fresh .....35
Storage .....26@28

Dealers pay for live poultry f. o. b. L. A.
Hens per pound .....18@19
Roosters .....9@18
Roasters 3 lbs. and up .....18@19
Spring chickens .....18@20
Turkeys .....20@24
Geese .....10@12
Ducks .....10@12
Squabs .....1.25@1.75

### Live Stock.

The following quotations are f. o. b., Los Angeles on all stock.
Hogs from 175 to 200 pounds.....7¾
Prime Steers .....4¾
Heifers .....3½@4¼
Calves per pound .....5
Sheep ewes per head .....3.75@4.00
Lambs per head .....3.75@4.00
Wethers .....4.50@5.00

### Potatoes.

Extra demand is causing firmness in the potato market.

Wholesale prices are:
Yellow Sweets per ctl .....1.35@1.60
Burbank local .....85@1.00
Highlands .....1.10@1.25
Salinas .....1.50@1.65
Watsonville .....1.50@1.65

### Onions.

Wholesale quotations:
Yellow Danvers .....1.25@1.35
Australian Browns per sack .....1.75
Garlic .....8@10

### Vegetables.

Wholesale quotations:
Artichokes locals .....1.10@1.25
Beets, sk .....80
Beans, string .....8
Brussels sprouts per lb. .....8@9
Bell peppers .....6@8
Cabbage, per sack .....85@1.00

### Honey.

White comb .....14@15
Light Amber .....10@12
Extracted W W .....7½
Extracted light amber .....6½@7
Beeswax per lb. .....25@29

### Hay.

Scott, Magner and Miller say:

Arrivals of Hay for the past week have been 2385 tons as against 3183 tons last week, showing quite a decrease. We believe this has been caused by dealers stopping shipments of their Hay, owing to their being overcrowded with the previous week's receipts, which were so difficult to move from the tracks without making large concessions to buyers, which meant large losses to themselves. Now that the tracks have been cleared, we look for another influx of Hay the coming week.

Our Oakland house reports very heavy receipts during the past week in that city; also that the demand is light and that concessions have to be made to effect sales.

On looking over the receipts on the San Francisco market for November 1908, and our market report of corresponding date of the same year, we find that there were 14,485 tons received in San Francisco during the month of November; that we noted in our market report that the market tendency was decidedly upward; that a little Foreign Hay was coming in from Nevada and Oregon; that the Interior demand was very strong, and that large quantities were being shipped to Los Angeles and other southern points, whereas this year, the receipts for the month of November were 11,882 tons, being 1600 tons less than last year, with a declining market, no Interior demands to speak of, the Los Angeles market lower than our own, and with no Hay coming in from outside States.

Both Alfalfa and Straw are quiet and inactive.

Choice wheat hay..... ..17.50@18.50

## Citrus Market

LOS ANGELES, December 8,1909.

The demand for navels has materially increased during the last week. The green tinge has largely disappeared and gives them a better chance with the large quantities of Floridas now filling the market. As soon as the trade becomes satisfied that navels are sweetening, they have a strong pull over all other varieties. The demand has tended to strengthen the market and to give a very slight advance.

Lemons are going forward about as usual and the few which the state is now able to send are picked up greedily and at most satisfactory prices. Foreigns are coming in to a limited extent but are not a strong factor.

**Shipments.**

Shipments from Southern California points to date since November 1st; 588 cars of citrus fruits of which 285 were oranges and 303 lemons. To same date last season there were shipped 644 cars of which 223 were oranges and 421 lemons. Since Noverber 1st, Butte County has shipped over 200 cars of oranges. The crop is the best in quality, size and production in many years, and will nearly all be on the market for the holiday trade.

---

NEW YORK, Dec. 3.—Two cars Valencias, one car navels and one car lemons sold. Prices fairly firm on Valencias, but market slightly easier. Navels lower account poor quality. Lemons strong, active, advancing. Weather cloudy, threatening.

## ALMOND COMMERCIALLY CONSIDERED.

(Continued from Page 589.)

meet the approval of every buyer and seller alike. Then why not?

Local associations, able to render much valuable assistance to each other in the way of providing spraying, hulling and shelling machinery, of promulgating advanced ideas as to varieties, production, detecting and fighting pests, proper curing and preparing for market, marketing, etc., is the first step. It should not be forgotten that uniform handling and standard grading will be necessary and of untold advantage to the grower. Nothing like it could be done which would so speedily put the almond production on a solid footing and relieve some of the other lines of orchard and vineyard production. It would bring multiplied wealth to our state, employment to our citizens by increasing production, and help to settle the food problem of the race, because it is one of the most valuable and condensed forms of food production.

At present there are organized associations of almond growers in Sutter, Yolo and Contra Costa counties, and in our own neighborhood we have a quasi association which handles 30 per cent. of our output. Every one of these associations has wrought good results for its members and the trade. Then why not extend the work of organization? Let the growers in every section or community organize an association and then all the associations select or form some central marketing exchange which shall do the marketing of the crop. This central exchange, with the foreign and home crop statistics before it, should determine what would be a fair price and should be given power to maintain said price. My word for it, the buyers would be just as glad as the growers to have this done if they understood it and they might be given a hearing in fixing the price, but always the growers' organizations should hold the deciding vote. This is a point which cannot be too strongly emphasized because it touches on the weakest point in our body politic today. The farmer and the fruit grower constitute the only class of people in the world wherein the producer does not fix the selling price on his own products. The manufacturer, the merchant, the professions, labor organizations, all say what their services and products are worth. Is it not high time for the farmer and fruit grower to wake up and take his stand along side of his fellow man? But it requires a Moses or a Joshua to mean success! Yes to be sure, and also be sure that whenever anything is right and needs a Moses or a Joshua, the Power that shapes the destinies of men and nations will not be found wanting with the man or leaders. It all means dollars for every one engaged in the business and that spells commercial success.

## ARTIFICIAL INCUBATION.

(Continued from Page 581.)

incubator does not have any, then air the eggs a good deal when it is warmest in the room and stir the outside eggs in, as they cool more quickly. However, at night the machine should be run high—103 degrees or a little more. If it gets low at night you can't air much the next day. If your hatch is right, notice the qualification, you can air the eggs several times slightly while the hatch is coming off but you can't if it is wet or sticky.

This is all there is to it: Even temperature the first half with much shifting, more ventilation the last half with more and more airing the eggs, not to run over 103½ degrees for long and not over 105 degrees in hatching time. All else is vanity and vexation of spirit.

Some take a pride in having chicks large and heavy when they hatch. This extra weight is only waste which the chick had better be without. Our chicks weigh when ready to ship about 1¼ ounces, but Minorcas as much as 1½ ounces each. With us it has been a matter of study for several years how to reduce the chick to its lowest weight which means a minimum of waste material absorbed. Fluffy chicks do not mean heavy chicks, the down has a tendency to grow long if temperature is rather low the last part of the incubation period and short if temperature averages high. We are now studying the wholesale brooding of chicks and we hope to give the Cultivator readers a report as to results in a few weeks.

## WHITE WYANDOTTES.

The White Wyandottes are especially adapted to California and are now one of California's most popular birds.

These beautiful birds of curves, are superior to their smaller sisters as fall and winter layers; when sold on the market bring more, and when dressed look much more tempting, being plump, with yellow skin and no dark pin feathers. Besides, white feathers bring more per pound when sold.

They do not suffer with the heat as do their larger sisters.

It does not require a high fence to keep them enclosed, they are gentle and docile and make good sitters and good mothers, are not lazy and are fast becoming the fancier's, market poultryman's and farmer's favorite in the West.—Mrs. C. D. Hubbard, San Fernando.

## Business Notes

### DO YOU NEED A TYPEWRITER?

If you are conducting any kind of a business or dealing with business houses you should have a typewriter. It was formerly considered a luxury; now it is a necessity. At $100.00, a machine is beyond the reach of the ordinary user. But the American Typewriter meets every requirement and is sold at the remarkably low price of $35.00. This may also be had upon small monthly payments.

We show a picture of this machine on page five hundred and seventy-nine in the advertisement of the William Peck Company. It is neat, compact, serviceable and will last a life time.

This company also handles typewriter supplies and sells them at exceptionally low prices. Their interesting catalogue will be sent free to those who write for it.

### NEW CATALOGS.

The Pioneer Hatchery Co., has the new 32 page illustrated catalog now ready. It contains articles on how to "Raise Baby Chicks" and another article 3 pages on "Poultry Pays." This is the largest book of its kind ever printed and is entitled the "Story of the Baby Chick." Mention this paper and send for it today, it's worth while. 1910 32 page "Success" Incubator book will be ready January 1st. Send your names today if you want these books. Pioneer Hatchery Co., 112 East 8th St., Los Angeles, Cal.

### ALL IN 144 PAGES.

The Aggeler & Musser Seed Co., of 113-115 South Main St., Los Angeles, has just issued its 1910 seed and plant catalogue. It has 144 pages of descriptive matter of all kinds relating to the garden. In addition on each page there are from one to four engravings more particularly illustrating the plants described.

In the last part of the book are tables of number of plants to the acre, calendar for planting and other useful [illegible] planters. It is a valuable little book and may be had for the asking.

One of the most pleasing calendars for 1910 that we have seen is the one sent out by our friends, the Vermont Farm Machine Company. It is in several colors and shows a pretty dairy maid in full regalia in the foreground, with a setting of trees, a running brook and a herd of dairy cows. And in the corner, is a United States Cream Separator. It is fitting that it should be there, because these famous machines make life a pleasure to thousands of dairy maids and dairy women throughout the world. The Vermont Farm Machine Co., Bellows Falls, Vt., inform us they will mail this calendar to readers of the Cultivator.

The Folding Sawing Machine Co., 158-164 East Harrison St., Chicago, Ill., whose advertisements appear in the Cultivator, have issued a very attractive and instructive catalog and price list. The book is so illustrated as to quickly convey the idea of the usefulness of the machine to the rancher. They have also arranged a table showing freight rates to the leading cities in each state so one can tell just what the machine will cost, delivered to your door. This book will be sent free to our readers if you mention the Cultivator.

# The Smooth Running Pomona Deep Well Pump

**RELIABILITY**

Has passed through another most successful season's run, this being the fifth since starting.

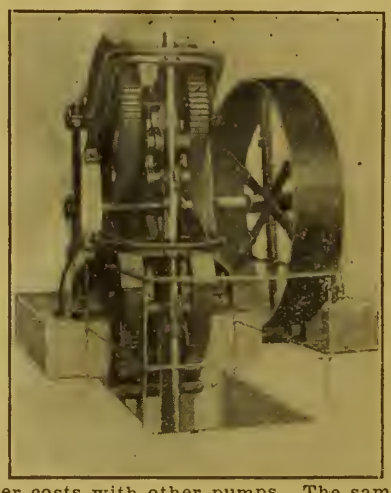
There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work we know and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

**ECONOMY**

May be driven by a steam engine, gas engine or electric motor, and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbitted and will last a lifetime with the smallest outlay for repairs.



We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

# Thirty-Sixth State Fruit Growers' at Watsonville

## Editorial Correspondence from One of the Most Instructive Meetings Ever Held Under the State Commission.

IT RAINED! It not only rained but came in sheets and chunks. From the first day until the middle of the last day of the thirty-sixth State Fruit Growers Convention held at Watsonville last week the rain did its best to dampen the ardor of its delegates. Notwithstanding that, the convention was one of the most successful ever held in the state, at least one of the most successful in that the program contained much of interest in the excellent addresses made, also in the attendance from nearly every part of the state. Even Southern California was well represented from almost every county. To give even a hint of the value of the addresses made before the convention will require many issues of the Cultivator. Two of these addresses were given last week, two will come in this issue, and others will follow. We do not believe any former convention brought together as many valuable papers as did this one. Unfortunately the program was too long, which deprived the delegates of the privilege of discussion, usually the most valuable feature of the convention.

**Cordial Reception.**

One feature which gave great pleasure to the delegates was the hearty reception tendered all visitors by the good people of Watsonville. The rooms of the Pajaro Valley Board of Trade were made headquarters. One of the first things called to the attention of the delegates on the part of Secretary Gretter of the Board and the reception committee was the barrel of cider with glasses handy, together with boxes of apples equally as free for the use of the delegates. The first thing to meet the writer's eye was a circle of delegates in the middle of the room, which at first had the appearance of an exceedingly warm discussion, but a close investigation showed the circle to be about a tub of apple peelings, each fellow peeling his own apple and saying nothing.

The rain deprived the delegates of the pleasure of a trip through the valley, which was scheduled for Thursday afternoon. This was in part made up by an exhibition of lantern slides of Pajaro Valley views and a "Letter to Ned" by "Majah" Judd. In fact we heard one delegate remark "that the best thing in this whole convention is Judd." Everybody knows Judd, but to refresh the minds of our readers as to who he is we may mention that one of the warm discussions around the tub of apple peelings was on the question "Resolved, that Judd's equator is longer than his meridian lines." The decision could not be reached until one of the boys suggested that decision be deferred until we visited the cider barrel. The unanimous verdict then was that "the cider is good." But seriously, Mr. Judd is one of those genial, whole-souled fellows with a smile for everyone, a smile so long that it reaches clear around behind, and was a great factor in making the delegates feel at home and adding enjoyment to every feature. Of course, C. H. Rodgers was another strong factor and everywhere and at all times was trying to meet the wishes of every delegate.

The ladies of the valley showed their hospitality and enthusiasm for the Convention by coming through the driving storm of Wednesday evening to tender a formal reception to the delegates.

PAJARO VALLEY SPUDS.

The ladies' orchestra and other musical talent of the valley added greatly to the pleasure.

**Resolutions.**

As usual the Convention was long on resolutions. The Resolution Committee was Messrs. Geo. D. Kellogg, Newcastle, J. P. Dargitz, Acampo, A. N. Judd, Watsonville. The hardest fought resolution was the one calling for revision of the horticultural quarantine laws. The Watsonville delegates were a unit in demanding a revision. The restrictions of the law are such that it makes its proper enforcement embarrassing. Tulare county growers have also found this to be the case. There is nothing in the law which permits allowing any expense funds to inspectors. This has compelled the Tulare county growers to raise funds of their own to bear the expenses which the inspector has to undergo in going from one part of the county to another. Watsonville delegates also wished to have a provision of the law which would permit the appointment of an entomologist or specialist to investigate any questions which require more talent or time than would be at the command of the inspector. State Commissioner Jeffrey and some others opposed the resolutions, but it seemed to be the wish of the attendants that an investigation be made and a report be made before the next convention, which would be before the next legislature and accordingly the resolution finally carried, endorsing the appointment of a committee.

One other resolution which occasioned some comment was that introduced after the address of Arthur R. Briggs, president of the State Board of Agriculture. President Briggs took the ground that Dr. H. W. Wiley, Chemist of the Department of Agriculture, should not hold the position which has been given to him under this government. In fact he did not mince his words at all that Dr. Wiley should be removed. The rank and file in the convention declined to take such a radical position but at the same time did pass a strong resolution endorsing the work of Mr. Briggs and commending him for securing as much as he has for California fruit growers.

Another resolution called for the appointment of a committee and authorized it "To compile from Congressional records the action of every Senator and Representative from California upon any phase of the parcels post which may come before Congress and supply the same to the press of the state." This committee as appointed by the resolution is made up of Edward Berwick, Monterey, John S. Dore, Fresno, and C. B. Messenger, Los Angeles. The point sought in the appointment of this committee is to bring to the attention of people those legislators who are friendly to the interests of the people and likewise those who are friendly to the express companies.

One resolution suggested that fruit growers of the state "begin keeping a record of the production as to quality and quantity of fruit, behavior of tree, time of blooming and ripening, also data as to any tree in orchard exceptionally valuable and after five years proving the continuous value and fixed quality these trees and records be offered to nurserymen for propagation as pedigreed fruits." It was further urged that all nurseries propagate only the best and most vigorous stock and that buyers should also refuse to buy inferior or "second" stock at any price.

## POMOLOGICAL CLUB.

THE Claremont Pomological Club held an interesting session at the home of Miss Stratton at La Verne, over 100 members and visitors being present. The principal feature, next to the bountiful dinner, was an exhibition of the Jewett Rotary Cultivator which was shown in practical orchard work and universally commended as a destroyer of plowsole and an excellent orchard implement. This tool was described in a former issue of the Cultivator.

Mr. V. V. LeRoy, secretary of the Club favors us with notes of the meeting from which we take the following:

In the discussion which followed the exhibition, a great many valuable points were brought out. It was generally conceded that six inch cultivating and eight to ten inches plowing is best for keeping orchard soil in proper tilth. For sandy or gravelly soil a lesser depth may be permissible. Sandy soil need not be cultivated between irrigations if a good dust mulch has been secured. The heavier soils should be cultivated as often as possible to do so. Some suggested that in heavy soil they would use a deep working subsoiler through center of row in late fall to facilitate the catching and holding of rainfall. Plow before cover crop is planted and get soil in fine condition for seed bed. Give the cover crop a good stirring when you can get a good stand to plow in by January or February. After plowing in be sure to disk the soil to break up the air spaces made by turning over the sod. After irrigating, cover in your furrows with a cyclone weeder or some such tool, then always cultivate crossways first as it is easier on your horses and you can do better work.

If you have water enough, use four furrows in old groves, but only one near the trees in young groves to force your feeding roots down as the trees grow. Mr. Jas. Mills of Riverside, said he had forced his tree roots to go down nine feet. Mr. Rumsey of Riverside, gave as his experience that orange tree feeding roots didn't go but two feet deep, and that splendid results were obtained. Others maintained that the roots could be made to go after the moisture as deep as nine or ten feet. Don't leave cover crops too late. Get them under in January or February sure. If necessary fertilize your cover crop with commercial or barnyard manure to make it grow. Especially in light sandy soil give an application of commercial fertilizer before sowing your cover crop so that it will be large enough to plow early. Root pruning sometimes is a good thing to increase crops if one has too heavy wood growth and little fruit. Mr. Mills was very emphatic as to fertilizing a little more than is absolutely needed.

"Don't have a tree infested with scale on your place. It is money out of your pocket, not to say anything about the harm you do your neighbor. At Redlands a prominent, influential owner, not an orchardist, couldn't see the use of fumigating. He was asked repeatedly to clean up but no one wanted to force him. His neighbor at last asked him to let him fumigate four rows of his orchard just to show him that it paid in dollars. He agreed and the next year the four rows had over four times as much fruit as the other rows." "Do anything possible to keep the red scale from spreading." said Mr. Mills. "When it gets in it will cost you enormously to get it out, if you ever do. Ten years ago we spent $45,000 on the Arlington Orchards cleaning up."

"Don't fail to grow a cover crop. It is the cheapest way to get humus and you must have humus. Commercial fertilizer is of no value without humus. By putting plenty of humus in the soil you make available much of the natural fertilizer, now unavailable in the soil. Humus also holds the moisture. Under the microscope much of our soil looks like cobble stones piled in a heap. Put humus into it and it looks like a sponge. A cubic foot of soil with plenty of humus will hold eight times as much water as without."

"Use nitrate of soda early in the spring in February and March if you want to stimulate the growth and blossoms. Nitrate of soda is better at that time because it is at once available while other forms of nitrogenous fertilizer require to be transformed from ammonia to nitrites to nitrates before the tree can use it. This is done by different kinds of bacteria which only work in warm temperatures, hence the ordinary fertilizers used do not become of value to the tree until the soil becomes warm later in the season. Five feet of barnyard manure well scattered is worth eight feet in lumps.

## ANOTHER WHITE FLY IN FOLRIDA

The attention of orange growers is called to the discovery for the first time in this country of a new species of white fly attacking citrus trees. In view of the wide-spread havoc played among the orange groves of Florida by the citrus white fly and the spotted wing white fly, the appearance among the orange trees at Tampa of another white fly which already has demonstrated itself to be of economic importance, is of interest.

During a recent examination of orange trees along several of the streets in the business section of Tampa in connection with the government white fly investigations being carried on in Florida by the United States Department of Agriculture, attention was attracted to dense white or grayish wooly secretions concealing the under surfaces of many leaves. Later microscopic examination has proved this to be a species known for several years to infest the orange trees on several of the islands of the West Indies, and especially Cuba.

Very little is known of the capacity for injury possessed by this aleyrodid. Mr. C. L. Marlatt, assistant chief of the Bureau of Entomology, found it quite abundant locally on several of the old orange trees at Artamisa, Cuba, in 1905, but noted that it had spread but slightly at that time into the surrounding groves. When describing it for the first time in 1907, Mr. A. L. Quaintance stated that, judging from its abundance on leaves sent the Bureau of Entomology from Cuba, it was a very serious pest of the Cuban orange, possibly rivaling

Florida Sour Orange Seed

The hardiest and most desirable strain in existence, best as a stock for all kinds of Citrus Fruits. We offer only good, fresh seed, grown and gathered with the expert care that has made Glen St. Mary Nurseries famous for quality. Don't take chances with seed of doubtful grade and uncertain value—buy of headquarters and *get the best.* Prices and full particulars on application to Clerk C. C. *Glen St. Mary Nurseries Company, Glen St. Mary, Fla.*

Pear growers of the San Joaquin Valley are planning to plant more extensively this year than in the past.

the citrus white fly, so well known in Florida. Whatever damage it is causing in Cuba, where it may be partially controlled by parasitic and predacious enemies, it has shown itself capable of rapid multiplication and spread in its new home at Tampa. Notwithstanding the fact that it has not been observed in Florida before, although many of the trees now heavily infested have been under casual observation during 1907 and 1908, it has become well established over a very large portion of the city, spreading northward beyond Michigan avenue and eastward into Ybor City. Trees across the Hillsboro river, on the grounds of the Tampa Bay Hotel, are well infested, hence it is safe to presume that the pest is well established in the western part of the city.

From the present infestation it is quite apparent that the insect first became established in this country near the water front. In this section neglected worthless trees along the streets and in door yards are in many cases heavily infested. While it appears to be rivaling the citrus white fly in the extent of its attack on some trees, it is improbable that it is capable of causing so widespread disaster. Yet if it once becomes abundant in a grove, it will prove a source of no little aggravation and discomfort to those working in the trees because of the large and extremely viscid drops of honey dew which collect over the bodies of the insects, and later become embedded in the copious waxen secretions.

In general appearance, the adults of this white fly very closely resemble those of the citrus white fly. Their wings are pure white, without traces of darker markings. Unless disturbed they lay their eggs in a complete circle and in this respect differ from the citrus or spotted-wing white flies. The immature stages, however, are very distinct from the last two species mentioned. When well grown they are shining black or brownish, with copious long hair-like secretions of wax, which are often much longer than the insect from which they arise, and when the latter are abundant, form such a dense matting over the insects as to completely conceal them from view. They are further distinguished from the white flies previously known to infest orange trees in Florida in that each insect carries on its back an unusually large drop of honey dew. This is a sweet secretion from the body which is so viscid that it feels like molasses when gotten on the hand. On the whole, this is one of the most easily recognized of the species of white flies.

What the future possibilities of this pest in this country are to be, remain to be seen. It is, however, important that growers be on the watch for it and report its presence to the State Experiment Station at Gainesville, or to the Government White Fly Laboratory at Orlando. A technical description, together with photographs and drawings published by the United States Department of Agriculture will soon be available for distribution.—Florida Fruit and Prod. News.

One Fullerton, Orange county, farmer is curing two and a half acres of fine tobacco.

## TO WIDEN THE FIELD.

The meeting of the board of directors of the citrus Exchange which was held on Wednesday last was one of considerable importance. Nearly the entire board was in attendance, and several out-of-town visitors were on hand taking notes.

Among other matters up for consideration was that of widening the field of the Florida orange. The time was when about all the oranges eaten in these United States were gathered from the groves of Florida. For some years past the enterprise and bustle of the California growers have been directed to the pushing of the fruit from that state to the front, while the growers of Florida have put forth no effort to hold the field. The result has been that the Florida orange has had little demand in some of the markets.

This state of affairs has been brought about by California not by "knocking" the Florida orange, but by attending strictly to business in advertising the merits of its own fruit, and it has not been niggardly in its expenditures for the purpose.

Taking cognizance of these facts the Florida Citrus Exchange has determined upon a vigorous campaign to the end that Florida's pride may find its way again into the highways and byways of the eastern part of the continent at all events. And so General Manager Gillett has been ordered by the directors to visit the eastern and northern markets and those of the middle states to inspire the men at the front. He will have on hand plenty of literature calculated to bring the Florida orange to the attention of lovers of this luscious fruit, and he will also make liberal use of the advertising columns of newspapers in those sections where there is the least call for the Florida orange. Mr. Gillett will leave on Sunday next to be gone a fortnight or more.—Florida F. & P. News.

## ENTHUSIASTIC OVER THE ORANGE.

A newspaper man at Arcadia, Florida becomes sentimental over the golden fruit and writes:

Oranges, oranges, the golden fruit that long ago made the Land of Flowers famous in history everywhere. They are on trees in front yards; they are hauled in double-decked wagons through the thoroughfares; they are overflowing the sizers at the packing plants; they are down town in the show windows and they are on sale at the fruit stands, and little tots lug them to school and boys play ball with them, and the peachy-cheeked, sunny-tressed girls feast on them, and oh, they are so very, very delicious! The best oranges in the world are grown in Arcadia.

Arcadia alone will send out some four hundred thousand boxes of the yellow globes. Later the right-of-way will be given over, so to speak, to the orange wagons, to the orange growers' autos and to the pickers. packers, shippers, and the famous fruit will go north hurriedly. And then you shall see Arcadia in full dress, orange dress. and receiving gracefully at the three handsome banks late afternoons, in fact, until the cows come home.

---

The large olive pickling works at Oroville is employing about 60 hands in its works and about 400 in the olive orchards gathering the fruit.

# Deciduous Fruit Culture

## THE LATEST DEVELOPMENTS IN FIG CULTURE.

**By Walter T. Swingle and G. P. Rixford, Before the State Fruit Growers Convention.**

FOR the first time in the history of Smyrna fig culture in California, the markets have this fall been partially supplied with home grown Smyrna figs that many experts pronounce equal to the product of the famous fig district of Asia Minor. We say partially, because the quantity offered is not one quarter part of the requirements of even the local markets. The writers know one buyer who never handles any but the best of everything, who wants ten tons of a certain pack put up at Reedley, Fresno county. This particular producer could furnish only about four tons from his young ten acre orchard. This is certainly an encouraging outlook for the industry and holds out the promise that when enough such figs are packed to supply the American market, the million dollars annually paid to the Turks will be paid to the California fruit grower.

The Smyrna is the best of all figs grown in the world and nowhere equalled in the eastern hemisphere outside the limited area of the Meander Valley, a district about 75 miles in length and 10 to 12 miles wide situated about 50 miles southeast from the city of Smyrna. The figs of Southern Europe, including Spain, Portugal, the south of France, Italy and Greece, as well as the north of Africa, all fig growing countries, have failed to yield a product which for tenderness of skin and delicacy of flavor compares with that of the Aden district mentioned above. It is therefore a matter for congratulation, that only in the sunny valleys of California, of all the world, can this delicious product be equalled.

One of the writers recently sent samples of the product of two growers at Reedley and one at Selma to the U. S. Department of Agriculture at Washington that must have produced a sensation, as a telegram was immediately received to send ten or twelve pounds more for exhibition purposes. The Department has taken a deep interest in the establishment of the industry on the Pacific Coast and is evidently impressed with the progress that has been made. In fact the industry has to a great extent passed the experimental stage.

### A Visit to the Principal Fig District.

At the instance of the Department it was the pleasure of one of the writers, two weeks ago, to make an extended visit to the fig growers of the central part of the San Joaquin Valley, in the counties of Stanislaus, Merced, Madera, Fresno and Tulare, where the industry has its greatest development, largely due to the efforts of Mr. Geo. C. Roeding of Fresno. More than a thousand acres have been planted in these counties, more than half in Fresno, most of which have reached the bearing age. There was a twofold purpose in this visit; one was to see the men who are putting up the splendid product, samples of which are here presented for your inspection, and the other was to ascertain the cause, and if possible, suggest a remedy for the discouragement known to exist among a portion of the growers. It cannot be denied that failures have been made and in a few instances bearing trees have been dug up. But it is a satisfaction to be able to say that with a little time and attention to details, the cause of the failures can be removed.

### Cause of the Failures.

With soil and climate well adapted to the industry, it is regrettable that any failures should have occurred. Intimate contact with a large number of growers has impressed the fact upon the writers that the great and paramount cause of failure is an inadequate supply of the fig wasp, Blastophaga grossorum. The crop depends absolutely upon the number of this minute, but beneficent insect that is supplied to the Smyrna trees and upon a sufficient number of good capri trees to support them. Here then is the condition of affairs with which we are confronted. Some growers have no capri trees at all, having neglected to plant them when putting out their Smyrna orchards. Many more have too small a numbe and not of the best kinds, while in some instances the trees are scattered about in the Smyrna orchards at considerable distances apart—too far for the trees to properly assist each other in sustaining the insect through the year. Occasionally a grower is met with—and fortunately the number is very small—who has perhaps mistaken his calling in becoming a fruit grower. One such in speaking of his small Smyrna crop, was asked if he had a good supply of caprifigs and the fig wasp. Replying, he said "there was a good many bugs flying about his place and he thought he was getting his share." It is not surprising that his crops are small.

In that portion of the San Joaquin Valley mentioned, the principal capri varieties are Roeding's No. 1, 2 and 3. While these varieties are excellent in some respects, others can be added to the list that will give much value to the whole. Some think that No. 1 is the best of the three, and it is valuable in producing an early profichi or spring crop. No. 2 seldom bears a mamme or overwintering crop, though an abundant profichi crop, and must therefore be planted where it can be fertilized by other capri trees. No. 3 generally carries a fair mamme and a good profichi crop. As some capri trees fail to produce all the crops required for the support of the Blastophaga through the year, it is recommended that several varieties be planted, that they may fertilize each other and thus with more certainty furnish an abundant supply of profichi wasps in early summer when required by the Smyrna trees.

### The Milco Capri.

Among the most valuable capri trees is the Milco, named after the late G. N. Milco of buhach fame. This tree has been under observation by one of the writers for some years in widely separated localities and under varying conditions of soil and climate and he has never found it to fail to carry an abundant mamme, a fair mammoni and a large pro-

fichi crop. As a striking evidence of the value of this variety it may be mentioned that a number of old trees, giants among their fellows, have been found that have carried the insect unaided by the proximity of other trees, for forty years. Some growers rely on this variety alone and never fail to have an abundance of fertilizing material. While one of the earliest producers of profichi figs, it is also one of the latest, and possesses the virtue of giving steady succession of profichi from the heginning to the end of its season. Most capri trees when under five years of age fail to carry an overwintering crop, hut the Milco is one of the most precocious in this respect of the whole list under observation. This tree then with our present knowledge of the hundred

It was supposed that the fig wasp was first sent to the new world from Algiers by one of the writers in 1899, but the discovery of the insect on the Gates and Lathrop trees, proves that the first introduction antedates that of 1899 by more than 30 years. A question of much interest in connection with the Gates and Lathrop trees is, how did they become occupied by the Blastophaga. W. B. West probably imported more fig trees than any other man in the state. In 1865, two years before the Gates tree was planted, he imported 22 varieties from the south of Europe by way of Panama, the first overland railroad not then having been completed. As it was possible only for the insect to he brought over in the caprifig itself, it is reasonahle to suppose that the trees imported by Mr. West carried mamme figs containing the insect and that it was estahlished

ANTELOPE VALLEY PEARS.
Courtesy Antelope Valley Ledger.

or more varieties now in cultivation in this state, is confidently recommended as one of the most desirahle to plant.

### History of the Milco Caprifig Tree.

In this connection it may he of interest to give a brief history of the first introduction into this country of the caprifig tree and the Blastophaga. On the ranch of Samuel Gates, ten miles west from Modesto, stands an ancient capri tree ahout 45 feet high with a spread of branches of 40 feet and a trunk eight feet in circumference just helow the hranches. The tree was planted in 1867 by Lewis Adams of Stockton, who purchased it with other trees from the late W. B. West, an enterprising and intelligent nurseryman of the same place, well known to many of the older fruit growers of the state. Of these old capri trees of which the Gates is one of the oldest, more than fifty have been located hy one of the writers. About 30 are growing in the vicinity of Ripon, two near Lathrop, seven at Stockton and about a dozen near Milton. Some of these trees are about as old and ahout as large as the Gates tree, and we have positive proof, have carried the Blastophaga for about 40 years. A numher of them have been traced directly to the West nursery and as they are all of the same variety, there is little doubt that they all came from the same source.

in the Stockton nursery before the trees were distrihuted. As all these old trees are of the same variety and most of them are known to have come from that nursery, it is a reasonable conclusion that to W. B. West helongs the credit, though prohahly unknown to him, of having first introduced the Blastophaga into America. That caprifigs on trees or cuttings could retain their vitality long enough to make this possible has been proven hy one of the writers who took cuttings with mamme caprifigs attached, from trees in the Maslin orchard last Decemher and planted them in his yard in San Francisco. In May following the wasps were alive and about ready to issue, but a spell of warm weather in June dried up the figs and killed the insects. This shows that even on unrooted cuttings it is possible to keep the insect alive for six months. This introduction hy Mr. West was undoubtedly accidental. The late Mr. Fred West, cashier of the Stockton Savings Bank, was at the time of this importation a partner of his brother in the nursery business. He said to one of the writers, just before his death, less than three months ago: "If we imported the capri tree ano the Blastophaga, it was purely accidental, as we knew nothing about either the capri tree or the insect, hut thought we were sending out a choice variety of the Smyrna fig."

(Concluded next Week.)

# Small Fruits and Vegetables

## THE BERRY INDUSTRY.

**Before the State Fruit Growers Convention by W. T. Newcomb, Sebastopol.**

IN TAKING up the question of the berry industry this paper will be confined to Lawton blackberries, Antwerp and Cuthbert raspberries, Loganberries and Mammoth Blackberries with incidental mention of a few other varieties that are grown in the foothill region of Western Sonoma adjacent to Sebastopol and locally known as the Gold Ridge country.

While the growing of strawberries is carried on to some extent one of your large "patches" in the Pajaro Valley contains more than our entire acreage. We leave this variety to the Watsonville district whose reputation for growing this berry is world wide.

Berries have been grown in the Sebastopol district since 1872. At that time the late W. J. Hunt planted the first blackberries. It was soon proven that the sandy loam soil, together with the moist cool summers, tempered by the coast breeze, and an abundance of winter rains, made it a favorable place for berry raising.

The first planting was of the Lawton black variety, and its adaptability has been proven by the test of time, for today it leads in production by double all other varieties combined.

The planting of Lawtons was soon followed by the Antwerp raspberry, which was usually called the Cuthbert, but differs considerably, both in fruit and growth; not being so rank a grower and fruiting in a shorter period; making it better suited for canning purposes into which the berry business developed, as San Francisco was the only fresh market available, and the profits from planting these two varieties stimulated planting to such an extent that in a few years there was such an overproduction, that if the canneries had not taken hold of them the berries would not have been worth raising.

During these years of development berries showed the same fault that all other California fruits have shown; viz: production taking place faster than consumption. The finding of new markets for this class of fruit at a distance was considered impracticable on account of its perishable nature. The first attempt, when the production became too large for the San Francisco market, was in evaporation. Good success resulted from this effort and a good trade was built up. Then the cannery came into the field and the tide ran the other way. No berries were dried, consequently that trade was lost.

The cannery requirements for berries were easily met. Fruit too ripe for shipment was in just the condition for them. This led to loose methds of picking and handling and quantity only was considered, until the grower was handling his berries about the same as he would a hay crop, and was only sorry he could not use a derrick fork.

All this led to one result; the canneries saying they had more berries than they could handle at the price; consequently a gradual lowering of prices until during the past two years the returns, based on the valuation of the land and labor, would not pay the cost of production.

This may look like a dark situation for the berry growers but fortunately our eggs are not all in one basket.

**Cultivation.**

Cultivation of our berries consists of thorough plowing, hoeing and cultivating; no irrigating being done. Different habits and growth of the varieties however require different training. The Lawtons are upright growers and are usually planted eight feet apart each way. The plants are obtained by digging the shoots that are thrown out late in the season near the "hill." The second season of growth the vines are staked with two redwood stakes, 2x2 and six feet in length. They are driven one on each side of the vine close in but spreading at the top to allow for lateral growth and ease in picking.

The raspberries are grown without stakes and are planted more closely. A good way to plant is; 3x8 and allow to make a solid row one way.

The Antwerp raspberry is a heavier bearer than the Cuthbert and slightly more acid. The light, dryer and more sweet Cuthbert has better carrying qualities for shipping fresh, but has not proven entirely successful in our locality, from bearing too much second crop in the fall, especially when we have early rains. Evidently the season is too long. At Puyallup Washington, 750 tons of this variety are raised annually, but their spring is a month later than here in California and the fall a month earlier and they are not troubled in this way.

The Lawton blackberry and the raspberry were the only bush berries grown until the advent of the loganberry; originated in your neighboring Santa Cruz. This berry met with favor from many, its term of fruiting filling in a gap before the later Lawtons. Its adaptability to a great variety of soils and climate has given it a wide planting and its vigorous growth and prolific bearing have made it a favorite garden berry.

The success met in crossing the California dewberry with the red raspberry which gave the logan, led to experimenting, resulting in the past few years in several new varities. The value of some of these remains to be seen. Probably the next best of these crosses is the Mammoth blackberry, a cross between the native or wild blackberry and Crandalls. That berry is in full fruiting at the time the Logans are on the wane and the Lawtons are beginning to ripen. Thus in our section we have succession of Logan, Mammoth and Late Black as we are beginning to call the Lawton since the Mammoth has come into the market.

Another new variety is the Himalaya a strong grower and good fruit, and may prove a good berry in some less favored climate and soil, but so far does not seem to supplant any of the older varieties. I suspect that one reason for this is the quite thorny nature of the vine, but it certainly is a hardy grower and will eventually find its place.

The Logan, Mammoth and Himalaya are running vines and have to be trellised. This is done in the winter; two wires being used one above the other at two and three feet from the ground. The plants from these varieties are got from "tippings"; which

(Continued on Page 631.)

# Eucalyptus

We have the following varieties in stock at this date.

**Eucalyptus** amygdalina (Peppermint Gum);
500 Cornuta (Yate Tree);
Crebra (Narrow-Leaf Ironbark);
168,000 Globulus (Blue Gum);
Goniocalyx (New South Wales Blue Gum);
1000 Leucoxylon (Victorian Ironbark);
3000 Polyanthema (Red Box);
1000 Resinifera (Red Mahogany);
700 Robusta (Swamp Mahogany);
32,000 Rostrata (Red Gum);
13,100 Rudis;
53,300 Tereticornis (Forest Red Gum);
28,000 Viminalis (Manna Gum);

# The Ornamental Garden

## THE ARRANGEMENT OF CUT-FLOWERS.

THE art of arranging cut-flowers, whether it be on the dining table, in bouquets or vases is not a very good subject to write about. It is like music or painting, you can never learn how to do either by reading or hearing someone tell how it should be done, yet there are a number of points that can be reduced to writing which may be serviceable to anyone interested in the subject.

A visit to the work room of an up-to-date florist's establishment will reveal the fact that practice is essential, if nothing else, in arranging flowers.

I think all who love flowers have the ability to arrange them, although it may be undeveloped. The question, what is good taste? is rather a hard one to decide. There are many creations turned out of reputable florists' shops, that pass as the proper thing, just because the work bears the name of an artist in the trade. The rules that govern the artistic are so subtle and undefined that few have the courage to criticise if the work bears the name of a prominent florist or is considered to be the correct thing.

If you will make a round of the different florists' stores during the Easter season, you will very likely see palms and other plants decorated with colored paper or ribbon. The incongruity is apparent when you stop to consider how impossible it is to decorate the most beautiful objects in nature. You can decorate with flowers and plants, but you cannot decorate flowers and plants with artificial material, and not infringe upon the laws of good taste. This is to a certain extent the key to the whole subject. Flowers being the most beautiful things on earth, the correct arrangement consists in showing them off to the best advantage. To do this you must study the flowers themselves.

We cannot but admire some of the wonderful creations of the florists' art, but after all they show little more than just what can be done with flowers and ribbon, and what ever the combination, and however skillfully put together, they are not more beautiful or more artistic than the individual flowers themselves.

It is very doubtful if there has ever been a floral piece put together that is equal in refinement of beauty to a dozen good American Beauties with their own handsome foliage or a few choice orchids loosely arranged with farleyense fern.

A bouquet made of one kind of flowers may be considered the simplest kind, and it might be added, the best, if there was a supreme court to decide such matters in place of that tyrant lady, Fashion.

In arranging a bunch or vase of flowers of one kind, there is a very good rule to observe, and that is let the shape of the bunch in outline be the same as the flowers used, for instance if the flowers in question be tea roses, the outline should be somewhat conical; if broad like the carnation, the flat topped bunch will be the best. The very choicest buds should have the most prominent positions, while the more expanded blooms should form the base. The same might be said of color—the heaviest should not be above the light ones.

In arranging colors it is well to remember that nature lays her colors on solid, and as a rule when two contrasting colors are produced in close proximity, one is merged into the other by gradual shading; of course there are many exceptions to this rule, such as may be seen in the ringed markings of the Gaillardia, or in the annual Chrysanthemums, but when it does occur it looks artificial and unnatural. It is impossible, however, to give rules how to arrange flowers, the most that can be done is to point out the laws which should govern good taste.

For green to mix with flowers there is none equal to their own, but with such flowers as carnations, it is almost impossible to obtain sufficient for this purpose, and in such cases the best substitutes have to be used.

All made up floral work is distinctly professional, and it is interesting to note the evolution from the bouquet of a few years back, with its paper frill and its short stemmed flowers all gummed and wired up, to the loosely arranged flowers on long stems that are in vogue at the present time.

In arranging cut flowers in a basket, vase, or bunch, artificial arrangement should be avoided as much as possible, and every flower made to show itself individually. A few blended shades of color as a good contrast, are all right, and always safer than too many mixed colors.

The principal exception to this rule are the different colors of one kind of flowers, such as Sweet Peas, Chrysanthemums, Dahlias, Asters and such like, if they do not always blend well they seldom shriek at each other and the effect is pleasing.

A person that really loves flowers can hardly fail to arrange them effectively in the home. Given Pansies, a shallow dish would be procured instinctively, so as to show their faces off to the best advantage, Poppies would be placed in a tall, slender-necked vase, so they would stand up and look as if the wind was blowing through them. Paeonies need a wide vase to themselves; they are too massive to mix with other flowers and so on all through the list of different kinds.

Cut-flowers are so perishable that intelligent handling and care are almost as important as tasteful arrangement. In the winter, when nothing but the greenhouse product is obtainable, there is not much to it, all that needs be done is to see that the water is kept fresh, and keep them in as cool a temperature as possible.

In the summer, however, it is different when it is possible to go and cut flowers from the garden; at this time the heat is the greatest trouble there is to contend with. Flowers are always better cut in the morning, before the sun has too much power. In any case it always pays to place them in water in a cool dark cellar for an hour or so to cool them off, before bringing in.—E. Hemming.

# Eucalyptus

We have a very fine lot of these trees in variety, ready for immediate shipment.

**Orange and Lemon Trees**

Our Citrus Trees are of the very best one and two year buds. We claim to have the finest trees on the market for the next season's planting, in any quantity. We are also large growers of

## STATE FRUIT GROWERS CONVENTION.

(Continued from Page 603.)

The standardizing of all deciduous fruit packs prepared for inter-state shipments was emphatically endorsed and urged and that every section of the state unite and make this standard uniform. Also that the standardization should be applied to dimensions of boxes. To secure the standardization and better over-sight of packing, also to secure if possible more just freight tariff, a resolution was passed calling for a committee of ten, appointed as follows: "Five from the California Fruit Distributors, two from the California Fruit Exchange, and three from the Independent Fruit Shippers."

A resolution which caused some little discussion was the one suggesting the cessation of planting of grapes, peaches and some other fruits which are now apparently being produced in too large quantities and the planting of more almonds, figs, pears and such other fruits as are now being imported and are not being produced in this country sufficient to meet the demand. R. D. Stephens and some other delegates felt that the convention should not take the dangerous ground of suggesting any particular fruits to be grown or restricted, that it was a matter for the individual planter to take the chances as to what the future should develop as to any particular phase of the industry. However, it was generally deemed that this amount of advice could be given to newcomers of the state and others who should ask it.

The pre-cooling of fruits and greater care in picking and packing were emphatically endorsed.

More rigorous enforcement of the horticultural law, especially that portion of it touching upon obnoxious weeds and pests, was recommended.

In view of the fact that the reputation of the state as a fruit growing section is so greatly menaced by the condition of public highways which is such that the keeping quality of fruits which are hauled over them is menaced, the demand was made for the best roads possible in all horticultural districts. It may be noted, however, that no endorsement was made of the proposition to bond the state for $18,000,000 for good roads purposes. An address was made on that point by state engineer Ellery on which there was no favorable discussion and delegates in private were free to express themselves opposed to voting such a sum until its disposition could be safeguarded more than it is at this time.

Dishonest promotion schemes were unqualifiedly condemned and the request made that "The Legislature be asked to pass such acts as will protect the buyer by compelling the seller to publish the soil analysis and character of land offered for sale in accordance with government survey."

WHERE PART OF WATSONVILLE'S 3500 CARLOADS OF APPLES ARE PRODUCED.

The report of the committee on freight rates consisting of R. D. Stephens, M. E. Angier, and C. M. Hartley, which was presented in a booklet of 28 pages was endorsed after a presentation by Chairman Stephens. This is the first time that Mr. Stephens' report has ever gone through the convention without strenuous objections. The posltion taken by Mr. Stephens was endorsed by practically every delegate. The report called attention to the fact that deciduous fruits now pay from $1.15 to $1.45 per hundred pounds as against $1.00 for lemons and $1.15 for oranges, also $1.00 on apples. The effort on the part of the committee is to secure a dollar rate on all deciduous fruits.

Purity of chemicals used in spraying, fumigating, and other horticultural work called for a resolution demanding supervision over these chemicals. Some chemicals like cyanide of potassium are produced of such quality and at a price so controlled by the trust that it is possible that state supervision will not have much effect upon them, but other chemicals produced of uncertain quality, like certain packs of our fruit, need "standardizing."

It was urged that a chair of farm economics be established at the agricultural college. Californians have been educated to produce a good quality of fruit but they have not yet been educated to stand together and use good business judgment in the disposition of their fruit.

The resolution endorsing a government line of steamers from coast points to Panama went through like a whirlwind without a dissenting vote.

* * *

**Notes.**

The first day of the convention was honored by the presence of the Governor and Lieutenant Governor of California.

This year's program was honored with the presence of one woman, Mrs. C. H. Rodgers making an address on the topic "Apples on our Menu."

Plant more almonds. Plant more figs. Plant more pears. On all these fruits we are short of the demand. Almonds especially need more extensive planting where one has the right conditions. Above all see that these conditions are right before making any extensive plantings.

Like a famous pickle advertiser, Watsonville has "57 varieties" or at least along the railway track within her limits are 57 separate packing houses. These range in size from one that packs and sends out 300 car loads annually down to the smaller houses with only a few cars.

Pajaro Valley has already shipped more than 3,000 cars of apples and every delegate to the convention knows they are fine.

Like the big meat packers, Pajaro Valley apple packers are saving the waste. The fine fruits are shipped, the lower grade are evaporated, the cores and peelings from these evaporated fruits are made into vinegar, the better grade of culls are made into cider, and the greatest waste of all and one that looked almost sinful was to see the great wagon loads of pomace hauled off to the river and dumped into the current. Why this pomace is not used to add humus to Watsonville soil is a query. The only answer given to us is that their soil is so rich it does not need it.

YOUNG APPLE ORCHARD WITH INTERCULTURE OF SMALL FRUITS.

Col. John P. Irish was the picturesque figure in the convention. His address was equally as picturesque and he drove home the fact that after all the skill we may wish to put into the production of high grade fruit is exercised, we still must use highest intelligence in marketing or our efforts will be in vain. In fact he would establish as a slogan, "first catch your market then plant trees." He said "the time when stuffed roast pigs were running around begging people to eat them has passed."

We wish we could give every p delivered at the convention in one issue. They are worth it, will inspire producers to grow best fruits in their power, but i readers will be patient they wil

pear one by one until they have all been given. The one by Prof. Hermes of the State University which touched upon advantages and disadvantages of certain insect pests which relate to rural hygiene will cause us to keep cleaner premises and prevent the pest of flies and mosquitoes by proper cleanliness about the premises.

Santa Rosa and Lodi both made an appeal for the next convention. Final decision was not made on the question and the matter is now in the hands of State Commissioner Jefrey for final decision.

Prof. A. V. Stubenrauch thinks that the table grape season may be practically doubled by the investigation in cold storage and greater care in picking and packing.

"Whatsonville is all right" was the general verdict of every delegate as he packed his grips to leave.

Parcels post will not down and the stage of "resoluting" is passing and those who are pushing it will want to know the reason why and as to who is responsible for its failure, if it does fail, in the future.

The pronunciation of "Pajaro" was a stunner to some of the newer comers to the state. We heard a delegate asking one of the reception committee whether the name of that valley was pronounced Paj-a-ro or Pa-ja-ro. The natives are very sensitive on that pronounciation. It should be Pa-ha-ro with first syllable accented, the a being sounded as in father.

Commissioner Jeffrey stated as an axiom; "He who teaches production without teaching marketing, is an enemy of the state."

Dr. Snow in his address stated that if California could stop the untimely deaths of those who are yet of a productive age, the population of the state would be increased by 100,000 in twenty years.

There were more of the oldtime attendants at the convention than for several years, and with it all many new faces.

Col. Irish suggested that if fruit were beginning to prove unprofitable it was time for us to turn to hogs. We are annually importing millions of dollars worth of pork.

Pajaro Valley's productive area is about 100,000 square miles sending out annually three million dollars worth of apples.

APPLE PICKING SCENE IN WATSONVILLE.
Courtesy Chamber of Commerce of Watsonville.

### PEACH BLIGHT.

Growers whose orchards are affected with peach blight should proceed at once to spray with Bordeaux mixture. In fact, it is getting rather late to combat this perplexing disease, but as a rule growers prefer to wait till the last moment so as to prune the tree first and so reduce spraying area as much as possible. The best results are secured by spraying from the last of October to the last of December. After the first of January results are much less satisfactory. Spraying at this time has little effect on peach leaf curl. It should be done later in the season to be satisfactory. When orchards are affected with peach worm two sprayings will give immunity from these three troubles, that is the early spraying for blight and late spraying with sulphur, lime and salt wash for the worm and curl leaf. The sulphur-lime wash has been found fully as effective with the curl leaf as the Bordeaux mixture and of course destroys the worm.

Bordeaux mixture for the blight may be prepared as follows: Twenty pounds of lime should first be perfectly slacked in a considerable amount of water, stirred and strained to make a perfectly smooth whitewash. Then dissolve twenty pounds of bluestone in water—a solution of any known strength which can be used as a stock, may be made. In mixing these two stock solutions, the lime and bluestone, plenty of water should be used to keep them well dissolved. Pour together in a vessel and thoroughly churn to mix. It may then be strained and diluted with the remainder of the water. This forty pounds of lime and bluestone is sufficient for 200 gallons.

If the pruning cannot be done before the spraying be sure that a thorough job is done, and then the pruning may be done at any time after the spraying. Some growers prefer to go over the sprayed trees a second time, making sure to cover all limbs where the wash did not take effect the first time. Every twig must be covered with the spray. Many growers soak the trunks and limbs, leaving the twigs untouched though they are the part most affected by the blight. The least portion of the twig left uncovered provides an entrance way for the blight.

### REASONS FOR PRUNING.

1. Because most trees produce more buds than they can possibly develop into limbs.
2. To develop a strong framework and stocky stem.
3. To compel laggards to grow more rapidly.
4. To keep vigorous growers under control.
5. To correct the evil habits of a variety.
6. To remove diseased, broken and undesirable limbs.—Pacific Homestead.

# Frost Prevention

**Saving Fruit Crop by Simple Means**

With the possible exception of the loss occasioned by insect pests, there is probably no one cause of loss so seriously affecting fruit crops as frost.

# An Extraordinary Work on Practical Farming

***Just Completed by L. H. BAILEY***

***Director of the College of Agriculture, Cornell University***

## A Complete Library of Outdoor Books in Four Volumes

This great work of Prof. Bailey's is most exceptional. We have hastened to make special arrangements with the Publishers whereby our customers may secure the complete work on unusually favorable terms, because we know that

**Everyone Interested in Growing Things Will Find It Profitable.**

No such work has ever before been published. No one man alone could possibly write so complete, authentic and practical a library on growing things; for, in addition to Prof. Bailey's own able writings, this work embraces the concentrated experiences of 300 specialists, each one of whom has been chosen as being the very highest living authority on his subject. This work is called the

**Cyclopedia of American Agriculture**

and is complete in four handsome, quarto volumes, so profusely and accurately illustrated that every part of the text is made clear enough for the veriest novice. It treats of the Planting and development of a farm, or orchard, irrigated fruit farm; up-to-date Nursery; General Truck Farm; Intensive Market Garden; Cut Flower Industry, Capital required for all, and hundreds of other important things too numerous to mention.

Besides these important matters, every subject vital to a Livestock farm or Dairy is thoroughly treated. Capital required to install a dairy, plans and directions for construction of most economical and most profitable buildings and machinery, with particular reference to sanitary Dairy stables.

**A Volume on Farm Livestock**

treats each animal separately and thoroughly. Cattle, horses, sheep, swine, poultry, and all domestic animals; how to select them, how to feed them and keep them in health, and how to breed successfully. Some of the best known experts in the country have made this volume the most practical treatise on farm stock ever published. A final volume deals in the most up-to-date manner with the sociological problems of farm life and the relation of agricultural interests to our national welfare.

# Irrigation and Forestry

## LUMBER CROP IMPORTANT PRODUCER OF FREIGHT.

LUMBER is one of the chief freight commodities produced by land. Its weight per acre surpasses corn, barley, oats, wheat and rye.

Few people are aware of the care used by railroads in keeping tab of the productiveness of land along their lines from the standpoint of the amount of freight produced by various crops. Heavier the crops per acre, the more business for the railroads. Nor are there many people who think of lumber as a crop, and one of the most important crops at that, which contributes a large share of the freight business of railroads.

The quantity of freight produced by a crop depends upon soil, region, and kind of crop. Railroads figure it from that point of view. Their profit depends upon tonnage and class, and they want to know what crop pays the carrier best.

Many averages in many localities are necessary to reach reliable results. Care is necessary, too, in applying to one region the figures obtained in another. Indiana, Illinois, and Kentucky are the center of a vast productive region, and averages there possess as much value as those of any part of the country, but, of course, they cannot be applied everywhere. An acre is credited with yield as follows:

| | Pounds Per Acre |
|---|---|
| Cabbage | 21,000 |
| Onions | 19,95 |
| Potatoes | 4,680 |
| Lumber | 3,0 |
| Hay | 2,710 |
| Corn | 1,728 |
| Barley | 1,2 |
| Oats | 886 |
| Tobacco | 877 |
| Rye | 848 |
| Wheat | 792 |

As the list shows, the three heaviest freight producing crops are cabbage, onions, and potatoes. Lumber is fourth. Up to the present time timber has been cut almost exclusively from wild land, without much regard to the acres gone over. But the time is coming when the yield of wood per acre will be calculated as carefully as the yield of corn, and as much thought will be given to growing it, though not as much work. How much wood grows on an acre in a year?

Some of the abused, burnt, washed, and neglected lands are producing only little. It has been estimated that the typical hardwood regions of Tennessee, where fire is kept out, are growing about 3,000 pounds of wood yearly per acre. Good stands of young pines in other parts of the country are probably doing as well or better. But this is not the limit, for foresters say woodland can do much better under forestry methods. Good timber must be selected, the poor cut out, just as the farmer plants the best kinds of corn and rejects the poor. In Europe where they raise crops of trees, they get, under favorable conditions, an annual growth of 4,500 pounds to 6,500 pounds of wood per acre. This country can do at least as well.

The freight carriers, however, seldom transport the whole wood growth. The waste is left in the woods or at the mill. This is much or little, depending upon what is made of the wood before the transportation company gets it. It is apparent, however, that after deducting for waste, the growth of an acre of timber furnishes more freight than an acre of any one of the agricultural crops except cabbage, onions, and potatoes.

The quantity of any one of these three commodities that will go to the market is limited by demand, but the demand for lumber is not diminishing. All that the forests and planted lots can supply will go to the market.

Woodland, under care, yields yearly crops as regularly as wheat fields.

The marketable timber only is cut at regular intervals, and new growth is always coming on. As a freight producer, a timber tract may be depended upon as surely as a potato field. In fact, it is surer; for land in farm crops wears out unless constantly fertilized, but timberland fertilizes itself with its leaves, and becomes richer. It will yield undiminished crops forever.

Trees grow on rough land where agriculture cannot profitably be carried on, and the freight and other returns from such regions are largely clear gain since such land would otherwise be producing little or nothing.

## PLANTING OF EUCALYPTUS.

The wonderful growth made by the city's tract of eucalyptus trees at the city reservoir in the Lytle creek wash, is a living illustration of what eucalyptus can be made to do on the moist lands in this portion of the valley. The trees on the city's tract have been in the ground but seventeen months and were whips when set. Now they average fully 15 feet in height and many are 20 feet in height and several inches in diameter.

A year or two ago there was a great amount of discussion here as to the encalyptus industry, many talking of making plantings. Not a great number were set out. A few tracts were planted, the Riverside Water company experimenting to some extent on their lands in this vicinity.

There are many thousands of acres of lands within short distance of the city which are as well or better adapted to the growing of eucalyptus trees than is the land at the city reservoir and most of these lands are now bringing a small or indifferent return to their owners. Some of these lands are in fact considered to be practically worthless.

These lands could be planted with eucalyptus which needs irrigation but one or two years, and in a few years a great and very valuable industry could be built up about this city that would rival even the orange industry in the value of the products. The timber would bring large and remunerative profits to the owners of the lands at a minimum outlay.

And the growing of the eucalyptus timber here in quantities would provide the raw material for the establishment of large and valuable

(Continued on Page 631.)

**Shibboleth** The great Bible game with cards; amusing, entertaining, instructive to old and young. Great lessons taught in morals and temperance from the leading characters of the Bible. A good Christmas present. 50 cents post paid.

**SHIBBOLETH CARD CO.**

434 Laughlin Bldg. LOS ANGELES, CAL.

# A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."

**Yours for 17 Cents a Day!**

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

**A Quarter of a Million People are Making Money With**

The OLIVER Typewriter

**The Standard Visible Writer**

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

**"An Oliver Typewriter in Every Home!"**

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

# Bees and Their Care

### TRANSFERRING BEES.

By Henry E. Horn, Riverside.

A LADY, Mrs. J. H. of Watsonville, wants to know "if now is a good time for transferring bees out of box into moveable frame hives." She says she can get bees in common boxes from a neighbor, at a low rate, and she is anxious to have a start with the honey makers. The lady referred to has been given a preliminary answer by mail, and promised full instruction through the Cultivator later on. But as there are many others who also expect to raise their own honey hereafter, and experience the recreative pleasure that work confers besides; and as, furthermore, a bit of advance planning is necessary, it is, perhaps, as well to give such advice as is at hand and seems fitting now, though the beginning of the season is three months ahead yet, and bee life just now at its lowest ebb.

It is a rule with all experienced beekeepers never, never to disturb their charges through the winter; and that for the good and sufficient reason that interference during the dormant or semi-dormant, period spells disaster now, and probably loss of the entire colony by the time the daisies open their star rayed eyes on the meadows. If bees must be transferred at all the best time is during fruit bloom, and before there is much new honey in the combs. The job is a disagreeable one, sticky and stingy in a high degree at best—this is the voice of actual experience—and after-results are scarcely ever satisfactory. But if one likes that sort of thing, or is obliged to do it, the following is the way to proceed.

Give your box hive bees a good smoking and jarring. After about five minutes pry loose bottom board, and the side running lengthwise with the combs. Smoke the bees out of the way. With a strong knife cut out the first comb you come to, brush off every last bee on it and put it in covered box. In like manner cut out all the rest. Leave the bees in their now empty box on their regular place. Take box containing combs into barn or kitchen. Take out one at a time and put on table, flat. Then take an empty frame out of the new hive (which should have been placed handy, all prepared before hand) and put over the comb in such a manner that it will take in the most and best of it, including all brood. With the knife cut around inside edge of the frame through the comb. Take trimmings out of the way; what remains will just fit the frame. A few strings around crosswise will keep it in place. Now place into new hive, brood in center. If possible empty frames should be filled with full sheets of foundation and placed just next to brood on either side. Then carry hive out and put on original stand of box hive. Dumping bees on top of frames and in front of entrance, fitting cover on snug, hive level and shipshape, completes the job, such as it is.

For the hive the standard Langoth size should have been selected. ere are three sizes of the latter, e 8, 10 and 12 frame capacity. any good beekeepers, particularly those working for comb honey, use the eight frame hive. But because of its small size it needs watching for stores in winter, and for much swarming in summer. Hence, for amateurs, and such as cannot give much time to bees, the ten frame is much more satisfactory. And only standard, mill made goods should be used. For unless things fit just so there will be stings, and a hot time, and swearing bye and bye.

But there is a better way to do this thing. By daily, or rather nightly, feeding of an ounce or two of diluted warmed honey, beginning about February 15th, and keeping the bees warm and sheltered, the hive may be so crowded with brood and young bees that a big swarm will be forced out as soon as fruit bloom is on, and new honey comes in regularly. That swarm, of course, goes into the new hive. It is best not to use too much foundation in the frames; strips two or three inches wide and as long as the frame, securely fastened along the under side of the top bar, one strip to each frame, is about as good as one can do. If, now, the new hive containing the swarm is put on the stand of the box hive, and the latter alongside of the former, one may by shaking about once a week the lately hatched bees of the box hive in front of the new depopulate the old in three weeks completely. It is to be noted that after each shaking the position of the box hive should be reversed, relative to the new, that is to say, if the former stood north of the latter before shaking, it should be put south after. For shaking, the bottom board must be off, of course.

If the weather is warm, and honey comes in freely the new hive should be filled out in ten days, for our honey bee is not only a master builder, but a miracle worker as well.

If the workers don't show three yellow stripes across the telescopic segments of their bodies, your colony is of the impure, hybrid variety, and a pure Italian queen should be given them—but that is another chapter.

But the concluding advice of an old hand at the business is, don't meddle with box hives alt all. Buy as many colonies as you want, of the standard size and pattern of hive with clean bill of health from some experienced and reliable beekeeper of your neighborhood. It may cost a little more, but the money would be well invested, comparatively.

The Department of Agriculture offers among its "Farmers Bulletins" one on "Bee Keeping" No. 59, of 48 pages. Any one may have that for the asking.

---

Do not touch a colony of bees at any time unless it is necessary and never when it is too cold for them to fly. Many people think it is a good time to move bees from one locality to another when it is cold. Excitement causes them to fill with honey. After they fill with honey it is very natural for them to fly. When moved or otherwise excited if the weather remains cold for several days it impairs the colony.

---

A campaign for good roads has been started in Placer county.

# CALIFORNIA CULTIVATOR CLUBBING PRICE LIST

## Good Until October 1, 1910

Periodicals in any club offer may be ordered to the same or different addresses. Foreign and Canadian subscriptions require extra postage and rate must be obtained by correspondence. Subscriptions may be either "New" or "Renewals" but it is important that this information be given in each case.

All orders must include a year's subscription to the CULTIVATOR. Write plainly all names and addresses to avoid error, and send all orders to the Cultivator Publishing Co., 115 No. Broadway, Los Angeles.

## Contents

FRUIT GROWING SCENES IN THE PAJARO VALLEY, Cover.

STATE FRUIT GROWERS' CONVENTION, 603, 609, 610, 611.

CITRUS AND SUB-TROPICAL FRUITS.—Pomological Club; Another White Fly in Florida; Enthusiastic Over the Orange; Widening the Field, 604, 605.

DECIDUOUS FRUIT CULTURE.—Latest Developments in Fig Culture, 606, 607.

SMALL FRUITS AND VEGETABLES.—The Berry Industry, 608, 631.

ORNAMENTAL GARDEN.—Arrangement of Cut Flowers, 609.

IRRIGATION AND FORESTRY.—Lumber Crop Producer of Freight; Planting of Eucalyptus, 612, 631.

BEES AND THEIR CARE.—Transferring Bees, 613.

EDITORIAL.—Good Roads; Be Square; Overproduction; Bee Keepers' Institute; Marvelous Story; Health for Farmers; Jewish Agriculture, 614.

AGRICULTURAL NOTES OF THE PACIFIC COAST, Northern, Central, Southern, The Coast, 615.

LIVESTOCK AND DAIRY.—Alfalfa; Hydrophobia; Lime in Stock Water; Profit in Pork in Hawaii; Stringy Milk, 616, 617, 618.

PROFIT IN THE POULTRY YARD.—Worms in Poultry; Chicken Pox; Change of Feed; Tuberculosis; Dry Mash; Diseases and Remedies; Making Turkeys; Can the Cockerels; Animal Food for Poultry, 619, 620, 621.

QUERIES AND REPLIES.—Belgian Hare Feed; Alfalfa in Young Orchard; Lost Registry; New Plums; Gum Disease; Keeping Flowers; Dried Olives; Almonds for Ventura, 622, 623.

LEGAL QUERIES.—Homestead Rights; Entitled to Damages; Public Nuisance; Assessment Statements; Cutting Trees on the Line; Trades a Horse; Planting Trees in Road; Who Bears the Expense; Trees on the Line, 624, 625.

HOUSEHOLD DEPARTMENT.—California My Own, The Key to a Man's Heart; Tried Recipes; Selection and Preparation of Meat; Treating Sweater Necks, 626, 627.

GENERAL AGRICULTURE.—The Spider a Benefit?; Diversified Farming in Tulare, 628, 629.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 630, 631.

## Good Roads.

THERE is one feature necessary to the shipping of better keeping fruit from California, and that is that growers unite in demanding better roads over which to haul products to points of shipment. A resolution was adopted at the state fruit growers' convention fully endorsing the good roads movement. Nevertheless we do not believe the convention was in favor of the eighteen million dollar bond proposition advanced by the present administration. The address by State Engineer Ellery brought out some discussion in opposition to the movement on the ground that the expenditure of such vast sums should be better safeguarded than is possible now. Taxpayers of the state realize that the investment of eighteen millions in good roads would make returns in proportion were it not for the proneness of political organizations to use such funds for strengthening their machinery by placing unworthy or incompetent people in charge. Granting that the present administration would handle the funds judiciously and with justice to all sections, we have no assurance whatever that it will remain in power. Mr. Ellery contended that the expenditure should be in the hands of competent engineers instead of men whose party affiliations or neighborhood friendships brought them appointment. This also may be granted, but will the state administration secure these capable and unprejudiced people more surely than will the county? The feeling privately expressed by many delegates was that the "organized interests" were at present in power as has been shown by the attitude of the state board of equalization in raising assessments on agricultural counties to the end that the assessment of railroads has been decreased thousands of dollars.

When the time comes that the people have some control over these matters through the recall or other methods, we believe such a proposition will be passed overwhelmingly, but if we can read the handwriting on the wall at this time, the bonding scheme will be defeated.

## Be Square.

ONE OF THE STRONGEST POINTS made in the address of John P. Irish before the state fruit growers' convention was the necessity for an honest pack. Disaster was visited upon several deciduous fruit sections this season from the shipping of unripe, wormy or undersized fruit. Thousands of dollars were lost in coin, and more in damaged reputation of California fruit. This loss was laid at the door of the producer by the shipper, at the door of the shipper by the producer, and both combined in laying it at the door of the Jap producer and shipper—all of which does no good. The only correction is "to correct" the evil, or to use Mr. Irish' words, "Be square and demand of every one with whom you deal the same honesty and square dealing." California's reputation for an honest pack has not been, perhaps, of the best, though not bad by any means, but a few seasons of shipments similar to the last would bring about that unhappy result. The movement started in Placer county and now spread over many sections of the San Joaquin Valley, is in the right direction. The orange growers have thoroughly learned this lesson and we believe this is the reason theirs is the most prosperous fruit industry in the state. Every shipper, whether he be Jap or white man, who does not send out a pack honest from top to bottom, is, and should be considered, the enemy of the state.

## Overproduction.

FOR THE FIRST TIME the state fruit grower's convention took the ground of discouraging further planting of some fruits in this state. This action has been threatened before by members of the convention, but never carried out. The returns for grapes this year and the fact that one small section of the San Joaquin Valley will soon be producing 10,000 carloads of table grapes, calls the attention of thinking men forcibly to the tendency of Californians to all flock in one direction. Table grape growing proved extremely profitable and the owners of thousands of acres rushed headlong into the planting of vineyards until now there are more table grapes produced than it appears the market can absorb profitably.

Embodied in the same resolution was a suggestion for planting more pears, almonds, figs and lemons, as these fruits were not over supplied and should bring to this state the millions of dollars now sent to foreign countries. This last feature called forth some opposition because of fear that some would plant these trees without using judgment as to whether their location were favorable or not. That, of course, is a matter which every land owner must decide for himself. That there is need of more diversified planting goes without saying.

## Bee Keepers' Institute.

J. B. NEFF, conductor of farmers' institutes for Southern California, informs us that the date given in last week's paper for the bee keeper's institute at Colton should have been Tuesday and Wednesday, December 28 and 29. These institutes which will be held in various parts of the state should be of great value to apiarists.

## A Marvelous Story.

WE HAVE BEEN HANDED A copy of the Buffalo Courier of Oct. 31 in which appears a two page advertisement, the entire space being a little less than a yard wide. This is one of the best examples of hot air advertising we have ever seen. The big wood type lines across the top of the page announce; "Luther Burbank's marvelous farm products will make your fortune." The advertisement is fathered by a company with a high-sounding name and liberal claims as to its own importance and to the worth of its guarantee. It has secured a body of land in Florida which it is willing to offer to the people for a consideration. "Never have you had such a wonderful offer made to you as we are making. Think of it, a ten, twenty or thirty acre farm in Florida that will yield from five to twenty thousand dollars, and is backed by an organization representing two millions capital. Not only will the land make you independent for life, but the work of this company, pledged to propagate, distribute and market Luther Burbank's wonderful products, will place you in a position to receive immense profits." "If you fail to take advantage of our offer, you are going to regret it to the end of your days," etc. ad infinitum. Occupying a prominent place is a personal communication from Luther Burbank in which he certifies that he has granted to this company the "control of the world for some of my latest and best creations" including "my very latest creation, the thornless cactus, superior to anything heretofore produced." Burbank's "marvelous creations," together with his picture and his picture again in his thornless cactus patch, are prominent features.

That this will catch thousand of eastern suckers goes without saying, and the pity of it is that they will be largely the people who can ill afford to lose their money.

## Health of Farmers.

ONE OF THE MOST UNIQUE addresses made at the fruit growers' convention was that of Dr. W. T. Snow. After Dr. Snow had stated that there were 10,000 lives sacrified needlessly in this state every year through lack of care in our surroundings and observance of rules of health, he asserted that each of these lives was worth to the commonwealth at least $1500. Therefore these deaths entailed an annual loss of $15,000,000. As to the individual Dr. Snow asserted that he really could not afford to die early. This, he said, might sound somewhat strange but is purely a business proposition. For the sake of his family and the commonwealth he should take care to assure himself a long life.

The rules which he gave for prolonging life prescribed plenty of sunshine, fresh air, proper food, sleep and a proper amount of play. Every citizen owes it to the state as well as to himself to keep himself in form for the best production.

## Jewish Agriculture.

IT HAS OFTEN BEEN REMARKED that a Hebrew farmer is unknown. Banking or merchandising have been the strongholds of the Hebrew race for centuries, but we note that one of the recent events in New York City was the holding of a Jewish Agricultural Fair. There has been an organized effort in New York to induce Jewish immigrants to take up the study of agriculture. This movement has succeeded to the extent that at this fair, participated in by Jews only, a most creditable exhibit was made. Beef animals were the only line of agricultural industry not represented. Dairy products and prize vegetables were prominent. There is now at Woodbine, New Jersey, a Jewish Agricultural school, also one at Doylestown, Pennsylvania.

WE HAVE received a number of inquiries in regard to the California Mutual Live Stock Insurance Association which has been under examination by the insurance department of the state since last October. A report recently filed characterizes the Association as "A private speculation in the guise of a mutual association.", The Association has not been "tied up" as yet so to prevent or interfere with its paying losses, but it was refused permission to continue soliciting new business.

# Agricultural News Notes of the Pacific Coast

## Northern California

Sonoma county hop growers are still receiving 24 cents for their crop.

Olive growers of San Joaquin county expect to handle a heavy crop this winter.

The Alameda Sugar Co. has started a campaign to increase sugar beet acreage in Yolo county for next season's run.

Oroville oranges are being rushed forward for the Christmas market. Prices reported for orchard run about $2.00 f.o.b.

The fruit packing houses of Red Bluff, Tehama county, have just closed down after a steady and successful run.

Gang plows are busy in Tehama county turning the sod for winter sowing of grain.

Fruit growers of Contra Costa county held a meeting at Concord recently and organized a co-operative marketing organization.

As result of examination for horticultural commissioner of Butte county recently held at Oroville, the successful applicant was Mr. Earl Mills.

The supervisors of Contra Costa county have appointed three road commissioners and details of a large undertaking for good roads have been planned out.

Pear growers in Contra Costa county have determined to wipe out the pear thrips or at least so control the pest as to make pear production more profitable.

The second demonstration train trip starts this week from Sacramento, going first to Auburn and other nearby points, later swinging around into the San Joaquin Valley going south as far as Tracy and Brentwood in Contra Costa county.

County Hotricultural Commissioners Newcombe and Galloway of Sonoma county, are holding meetings with the fruit growers and suggesting the formation of associations which will advance the merits of systemmatic spraying and caring for fruit.

Peach trees shipped into Potter Valley near Ukiah, Mendocino county, found to be affected with peach yellows, peach rosette and two forms of blight, were burned as soon as they arrived and proper inspection could be made. They were shipped in by an Ohio nursery.

At the annual meeting of the Woodland Creamery Association it was shown that the receipts for products sold the past season aggregated $157,287.32. There are 252 patrons of the creamery to whom has been paid during the year $149,345.99. The average price paid for butterfat during the year has been 33 1-3 cents. It is a co-operative organization.

The supervisors of Yuba county have enacted an ordinance which limits the load for teams from Dec. 1 to April 1 at 5000 pounds including wagon, instead of 3500 ds as was formerly the case. ase of heavy articles of ma- ry which exceed 5000 pounds, rdinance permits the hauling ding the tires are over six inches s the face.

## Central California

Work has begun on the erection of the fourth creamery for Tulare.

Last year the three creameries of Tulare paid out over $700,000 for cream in that neighborhood.

Three local buyers of beans in the Turlock district have paid out over $30,000 cash to growers this season.

Ploughing for grain planting is in full blast all over Kern county, in the mountain valleys as well as on the plains.

Some fruit growers in Tulare are urging that the next citrus fair of that county be transferred to Los Angeles.

The first solid trainload of apples ever sent to a foreign market from the Pacific Coast went from Pajaro Valley last week.

A meeting of raisin growers recently held in Fresno has organized a pool for the disposal of raisins, 2500 tons having already been signed.

Kern county reports grass already high enough for sheep. The prospects are that the number of sheep in the county will be larger than last winter.

Some eucalyptus trees planted in the cooler sections of the San Joaquin Valley have been nipped by the frosts. Some younger ones may possibly be killed.

Property owners living within the boundaries of the proposed Westside Drainage district near Fresno, have defeated the drainage proposition by a vote of 51 to 44.

Fruit shippers over the northern end of the state all propose to stand together and secure a reduction on freight rates on deciduous fruits, if such a thing be possible.

Butchers of Fresno county report that they can afford to pay more per pound for grape fed porkers than for alfalfa or grain fed hogs, at the same time increasing their own profit.

The L. F. Giffen Co. of Fresno, the large raisin buyers, who have endeavored to break up the raisin trust so embarrassing to shippers, are doubling their plants at Fresno and Fowler.

The University of California held at Monterey this week a farmers institute given over especially to topics concerning bee keepers. It was in charge of Mr. Ralph Benton of the University.

"Rainmaker" Hatfield is still working the San Joaquin Valley. This time he is endavoring to secure a contract from the farmers near Volta, a small town near Los Banos. The "rainmaker" claims that he can increase the ordinary rainfall one hundred per cent.

The organization recently formed at Porterville to look after the interests of citrus growers of that section, especially with reference to insect pests, is urging the formation of a county organization. The committee preparing by-laws is composed of J. A. Milligan, Hobart Webster, H. C. Carr, C. A. Boston, and W. P. Bartlett.

## Southern California

Picking and packing of oranges began in the Redlands district last week.

Southern California was visited by the heaviest storm of the season last week.

The value of walnuts shipped by Ventura county last year aggregated $370,000.

The Orange County Preserving Co. has canned this season 20 carloads of tomatoes.

Some 30,000 rainbow trout were shipped from the Sisson Hatchery to Santa Paula last week.

The county fair held in El Centro, Imperial county, last week was proclaimed a complete success.

The Forestry Society of California, with offices in Los Angeles, has elected Abbott Kinney president.

San Diego is getting ready for a great world's fair to be held in 1915 at the completion of the Panama Canal.

There are 19 cooperative walnut growers associations operating in Los Angeles, Ventura and Santa Barbara counties.

West Highland, San Bernardino county, claims that its oranges are ripening much earlier than in neighboring sections.

The big Limoneira Lemon Co. at Santa Paula, is still doing extensive drainage and other improvement work in its orchards.

The president of the Farmers State Educational and Co-operative Union delivered an address before the farmers union of Imperial county last week.

The Orange Growers Association of Hemet, Riverside county, has just settled up accounts for its first year's work. Returns have been most satisfactory.

A movement is on foot in Orange county to form a union chamber of commerce representing Placentia, Olinda, La Habra, Orangethorpe, and Fullerton.

Orange growers at Rialto, San Bernardino county, are pleased at the large increase of water supply brought about by the Mt. Vernon Water Co.

Producers of Orange county are exasperated at Japanese laborers, and the chamber of commerce of the county is asked to discourage their further employment.

A big feature of the fair held at El Centro last week was the exhibit of cotton, showing all stages of the industry from the growing plant to the finished product ready for the loom.

On Dec. 5th the Los Alamitos sugar factory, Orange county, finished slicing for the season, having handled a total of 80,635 tons of beets with average sugar content of 20 per cent, the highest ever.

The board of supervisors of Riverside county has passed an ordinance which makes it necessary for every person or firm in the business of spraying or fumigating trees or plants to first secure a permit from the horticultural commissioner of the county.

## The Coast

Bluestem wheat is commanding $1.12½ at Colfax, Washington.

Arizona navels are commanding as high as $3.75 for half boxes in the New York market.

Owing to the switchmen's strike potatoes have advanced a dollar per ton all around at Seattle.

The University of Idaho offers a short course of ten weeks in forestry, the term to begin January 7th.

The western parts of both Washington and Oregon have suffered heavy losses from the floods of last week.

The Portland Livestock Exchange offers $600 in premiums for best Christmas cattle received at the stockyards.

The coldest December weather given to the vicinity of Asotin, Washington, was on the 3rd when the thermometer reached zero.

Farmers about Lewiston, Idaho, are holding their wheat for a dollar a bushel. Over 7,000,000 bushels were produced in that district this year.

Klamath county, Oregon, has sent a carload of exhibits to the International Livestock Exposition at Chicago and the Corn Show at Omaha.

Alfalfa growers near Phoenix have found an exceptionally profitable crop in alfalfa seed. It is said to yield between five and six hundred pounds per acre.

An irrigation scheme at Weston, Oregon, contemplates expenditure of a quarter of a million dollars to build a dam 1100 feet long and 210 feet high.

Fruit growers of Milton, Oregon, held their annual meeting December 9th. Their association has handled over a hundred cars of fruit for the season.

Farmers near Reno, Nevada, are working for a factory having capacity of 600 tons of sugar beets daily and to cost in the neighborhood of a half million dollars.

At the annual meeting of the Chelan county horticultural association at Cashmere, Washington, on Dec. 18, the society will discuss the Lafean grading and packing bill.

Grain growers of Pullman, Washington, have already disposed of from eighty to ninety per cent of their crop. Those who still have wheat are holding for higher prices.

The farmers union at Lind, Washington, refused to join the combination agreeing to sell bluestem wheat at one dollar, and is now selling at several cents in advance of that price.

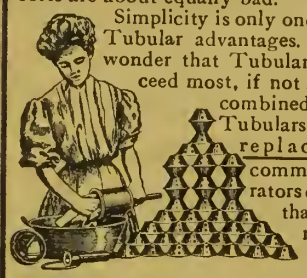
The Washington Livestock Association will meet in Spokane Jan. 4 and 5. Of importance to the entire Northwest will be discussion of efforts to secure uniform laws relating to the stock industry.

Many agriculturists in the Hawaiian Islands have begun to experiment with cotton culture. Director Wilcox of the Hawaii Experiment Station has been investigating cotton conditions on the mainland.

**LOOK**

The two upper pictures show absolutely all there is to the light, simple, sanitary Sharples Dairy Tubular Cream Separator bowl. It can easily be washed perfectly clean in three minutes and has twice the skimming force of common bowls. Wears a lifetime. The World's Best.

The lower picture shows a common, disk-filled bowl with 42 disks. Other sorts are about equally bad.



Simplicity is only one of many Tubular advantages. Do you wonder that Tubular sales exceed most, if not all, others combined? That Tubulars probably replace more common separators every year than any one maker of such machines sells? World's biggest separator factory. America's oldest separator concern. Branch factories in Canada and Germany.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## ALFALFA.

By Mrs. M. E. Sherman.

THE soil for alfalfa should be deep and mellow, as it is a deep rooting plant. The soil texture or mechanical condition should be loose or friable rather than hard or having the tendency to run together. Alfalfa plants have learned to put up with many adverse conditions and yet give returns of good value. Like President Taft this plant has learned the lesson of the necessity of compromising if things are to run smoothly. Well cultivated soil rarely fails to secure a "good catch of alfalfa." The land that fails to start off well is the old grain field or the land that has never been plowed at all before the time of plowing to set out the alfalfa. I believe it is safe to say without any reservation that the best stands of alfalfa in this neighborhood are found on land that has been in cultivation for years as orchard or vineyard. There are many small pieces of this character scattered over the neighborhood that are now in alfalfa, resting before planting again to vines or fruit trees. The catches are good also on land that has been cultivated the summer before it is planted to crops like corn, water melons, pumpkins, beets or anything that means summer cultivation and irrigation to put moisture, sunshine and air into the soil.

### Conditions.

The lands of California that are used to grow alfalfa are away from the Coast fogs and dampness and were often classed as arid before the building of the irrigation ditches. Now these desert land conditions have produced pronounced mechanical effects on the soil that must be considered in planting crops. The winter rains came on the great plains and the green vegetation sprang up quickly. These annual plants grew up rapidly, used the surface water and did not penetrate with their roots for more than a few inches below the surface. As soon as the rains ceased the grass dried and blew away. Now think of the conditions in the country beyond the Missouri River. There the summer rains induced decay and as the plants grew the leaves dropped off a little at a time and were beaten into the soil until a layer of vegetable matter was formed. This humus or organized vegetable matter was available at once for plant growth. In the California springtime the thick mat of vegetation on the surface used up the rainfall as fast as it came and the root systems were too shallow to go deeply into the earth. So neither roots nor rainfall penetrated deeply into the earth. We have, therefore only a shallow depth to which the air was taken into the land.

### Grain Farming.

The grain farmer was the first to turn over most of the soils in the State. The gang plows ran over many acres planting the grain at the same time and only doing shallow surface work. The grain farmers plowed and the cereals they grew were all shallow or near to the surface. The result was the forming in many places of plowsole, or as it is sometimes called, hardpan, at five, six or seven inches from the surface. This is merely a dense mass of hardened compact earth that must be broken up if the young alfalfa plant roots are to be properly nourished. The big two disk plows are the tools to do this work thoroughly. In the East these conditions are not met with to any extent owing to the freezing, for as the frost comes out of the ground it breaks up the soil particles into a mellow mass. We can secure this deep opening up of soil in California by the use of the cover crops to act as underground plows. The roots of the vines and trees when the land is cleared and planted to alfalfa are left deep in the ground and quickly the new roots find their way down along the channels of humus left by the decay of these roots to the under soils. In California the humus we have in the soil is less in quantity but richer in quality and goes down much deeper in the ground. As bacteria are always associated with humus it is enough to say that the soils of California carry bacteria at a greater depth than any known soils.

### Frosts.

The past two mornings have been very cold and frosty and it is good for the trees and vines as they go to sleep promptly and will not bleed under the pruning shears. The loosening effect on the grain land is noticeable and it makes the soil friable on the ground that was turned a little too wet. If the vineyards were all plowed when this cold came the thrips would be routed out. Today I noticed the thrips had taken refuge in the olive trees and were not in the leaves or on the ground of the vineyards.

### Checks.

The untrained eye is a gay deceiver as one finds out when he looks over an apparently smooth piece of ground that is to be leveled for alfalfa. When the surveyor's level comes into use it shows many irregularities. These irregularities should be leveled away, for it is a foolish waste to plant poorly leveled land. The fact that some land does not need irrigation every year makes it imperative to have it so that it can be irrigated when it needs it. The year that is very dry is the year that hay is scarce and will bring higher prices. If the land cannot be watered hay will have to be bought for the cattle.

Before leveling the land, plow it lightly merely enough to fuss up the surface to make it loose enough to incorporate well with the fresh soil laid on it in the leveling and checking. Then check the land carefully. Make the checks reasonably large. This patchwork of six or eight to the acre is foolish. Two is about right for average land and on some land one is plenty. The spots that have been scraped off should have some fine manure or corral scrapings put

on them. This is also a good way to work in some alfalfa bacteria by using manure from alfalfa fed animals. The manure used will need to be worked over with a fork until only the finer portions are left. The coarse loose stuff is then carried to the orchards and the finer stuff to the alfalfa field. Cover the scraped portions with the manure. It will not hurt to cover all the field if the manure is plentiful enough. The rest of the land may then be given a coating of gypsum, four to eight hundred pounds to the acre. When this is all on plow the land deeply and harrow and cross harrow until a fine seed bed has been formed. If it rains during this time so much the better, but keep the harrow going until the surface is smooth and loose. One reason why it is important to plow all the ground lightly before beginning to level at all, is that it is the only way possible to make the check solid enough not to seep water under them. A terra cotta tile placed under the check to carry the water into the next one and closed on the upper side with a wooden head gate will prevent washing out. The head gates should be numbered one, two, three, four and so on, as they come into use in irrigating the field. It is then easy to send a man out to open number so or so. When the highest checks are filled with water the inflow can be stopped and the extra water let off on the next checks. Less water is used and no scalding takes place. The necessity of having land checked for flooding at some time in the year is very great as the gophers are not easily held down except by the aid of water.—M. H. Sherman.

## HYDROPHOBIA.

The losses in horses and cattle from hydrophobia as well as the danger to the human, has caused the Colorado Experiment Station veterinary department to investigate regarding this disease and from a report submitted by Prof. B. F. Kaupp we quote:

Rabies, when affecting human beings, is called hydrophobia. As this disease has caused a considerable consternation in several sections of the state recently, a few comments in this connection may not be amiss.

First, let us see about some of the superstitions associated with this disease. When a person has been bitten by a mad dog, the killing of the dog does not prevent hydrophobia in the person bitten. This is a joke, and strange as it may seem, has been taken seriously by many people who should know better. Better lock the dog up for a few days and see if the disease develops. In case the disease does not develop the person bitten need have no further anxiety. If the disease does develop in the dog, the person will then have plenty of time to go to a Pasteur institute (in Chicago, or Austin, Texas), and take treatment, which will positively prevent the disease from developing.

Again, the common belief that a mad dog will run with his tail between his legs, and froth at the mouth is a mistake. The mad dog carries his tail in quite a natural position, and while the mouth may be open from paralysis of the lower jaw, yet he can not truly be said to froth at the mouth.

### Fake.

The "mad stone" is a fake, pure and simple. It is nothing but a piece of porous stone (like soap stone), which when dried and then placed on a moist surface will absorb water, or blood, or anything of a fluid nature. After a person is bitten by a mad dog, the germs of the disease are very soon absorbed into the system. The absurdity of going a week later to some remote part of the country and applying the mad stone with a view to its absorbing the poison, is too evident to be worthy of further comment.

### Not All Affected.

About twenty per cent. of persons bitten by dogs actually rabid will develop the disease, if they have not received treatment. About eighty per cent. of the dogs bitten will develop the disease, if the wounds are not cauterized. All warm blooded animals have this disease, or may take it by inoculation. The bite of a rabid wolf or a coyote is said to be very dangerous.

### Worth Remembering.

Rabid dogs are not afraid of water (hydrophobia). Paralysis of the lower jaw and the hind legs gradually develops. Beware of the dog that appears to have a bone in its throat—it may be rabies. The eyes in this disease are very sensitive to light; hence the dog usually crawls in under the porch, or some other dark place. Skunks are subject to this disease, and when so affected do not hesitate to enter houses and bite individuals.

If bitten by a suspicious acting dog, cauterize the wound at once, but do not kill the dog. If the dog develops rabies within five days, the person bitten should start at once for treatment. Don't get nervous and go into hysterics, even though you are sure you have been bitten by a mad dog. You will have plenty of time to take treatment before the disease develops if you start at once. Rabies is only transmitted by the bite of a rabid animal. If you go to a Pasteur Institute at Chicago, it will cost you a hundred dollars for treatment, besides other expenses. In Austin, Texas, the treatment is twenty-five dollars.

In case a mad dog is found in a community, all the dogs should be muzzled for sixty days.

## LIME IN STOCK WATER.

Sprinkle lime in the watering trough, and not a particle of scum will form on the surface. When the lime loses its strength, scum will begin to form, which may be twice during a season. Wash out the trough and repeat the dose. It is cheap, harmless, wholesome; keeps the water sweet and saves the livestock.

To breed and rear strong, healthy pigs, it is essential that the sow should be in good fettle and free from disease. It is not necessary to feed rich food when suckling her pigs, but a sufficiency of suitable sweet and wholesome food should be given.

If the hogs have not a southern exposure where they can lie in the sun out of the wind, give them one. They will do much better with it. Anything that increases the comfort and pleasure of stock makes it more profitable.

**Cured pulp from Los Alamitos Sugar Factory silo at $1.00 per ton.**

U. S. Cream Separators

The Recognized Criterion by which others are judged.

The modern dairymen want a Cream Separator that fulfills to the highest degree these three requirements:

**Close Skimming, Easy Running, Long Life.**

The U. S. is the only separator that combines leadership in all three of these essentials.

The U. S. has received more and higher awards (acknowledging its superiority) in 1909 than all other makes combined

A request for Catalog 20 will show you all about this thoroughly practical separator and tell you all about our latest awards.

# Do You Count Your Change?

Errors have occurred—always will. This fact makes it necessary for all classes of business to provide a way to "check" the work and "count the change."

Without a Scale the farmer neither checks nor counts his change while raising young stock; feeding, buying or selling cattle; sowing, thrashing, buying or selling grain; determining the results from each or any field. Cannot determine whether or not the scales on whose weights he buys and sells are out of condition—in fact if he never "counts his change" he cannot CHECK anything—not even his own guess. Has this condition shortened your profits during the past ten or fifteen years?

**Fairbanks Scales** have a world-wide reputation for accurate and reliable weighing. Every part of every scale is carefully tested and standardized before leaving the factory. The weight receipts of these scales are always accepted as correct by the commercial corporations, because they know that Fairbanks Scales are reliable and have been for over eighty years.

## BIG PROFIT IN PORK IN HAWAII.

Among the various lines of animal industry which can be largely increased, with good profit to those who engage in it, is that of pork production. At present the hogs raised in the Territory do not nearly supply the actual demand for pork. There is a constant and active call for hogs at ten cents a pound live weight, which is a considerably higher figure than is ever obtained on the mainland. During the past year one firm alone in Honolulu imported 35,000 pounds of pork loins from the mainland.

The climate of the islands is excellently adapted for pork production. Hogs can be allowed to run on pasture the year round and require a minimum amount of expenditure for buildings, feeding troughs, and other constructions belonging to the piggery. In order to get an idea of the profit which can be obtained from selling hogs at ten cents a pound, live weight, it is only necessary to consider the fact that in actual experiments, where all items of expense were carefully noted, it has been found possible to produce pork at from 1½ to 3½ cents a pound. A mistake, which has sometimes been made by pork raisers in the islands, consists in buying imported bran, barley and other feeds which bring the cost of production up to seven or eight cents a pound. At a cost of three cents a pound, there is sufficient margin to make a magnificent profit in raising hogs for any one who understands the business.

The troubles which the hog raiser experiences here are no greater than those to be met in the corn belt of the mainland. Hog cholera does not prevail as extensively as it does in the corn belt, and can easily be avoided entirely by exercising care in the importation of breeding stock. and by the observance of ordinary sanitary precautions.

The breeds which have thrived best are Berkshires and Duroc Jerseys; but other breeds may perhaps prove equally well adapted to our climate. On all of the islands there are considerable numbers of hogs which have escaped domestication, and which have developed a very hardy type of razor-back; but these wild hogs do not produce pork so economically as pure breeds or grades.

There is a great abundance of feeds suitable for pork production from which to make a choice. In most localities, alfalfa thrives well, producing ten or twelve crops per year, and may be fed green or grazed by the pigs. In addition to alfalfa, we have soy beans, cow peas, corn, and untold quantities of algaroba beans. On algaroba beans alone, hogs make a very rapid increase of weight at a cost of about 3½ cents per pound. These beans may be purchased at present for $7.50 per ton, which is far under their actual feeding value. Furthermore, papaias, taro and cassava may be grown in unlimited quantities and are economical feed for pigs.

With the present demand, far in excess of the local supply, and with the constant increase in this demand, there seems to be a better opportunity than in any locality on the mainland for a considerable number of farmers to engage in the business of pork production.—By Dr. E. V. Wilcox, Special Agent in Charge, Hawaii Experiment Station, Honolulu, Hawaii.

IMPERIAL VALLEY IS NOT ALL COTTON. Courtesy Calexico Chronicle.

## "STRINGY" MILK.

The books say but little about stringy cream, but a good deal about stringy or ropy milk. If the milk when first drawn shows no ropiness or stringiness, but, after standing twelve to thirty-six hours, develops a thickening and stringy appearance, there is no question but what bacteria are the cause of the trouble. There are many kinds of bacteria which produce this condition, but it is enough for our present purpose to say bacteria without going into the special forms which the bacteriologists have discovered.

Very frequently the milk is seeded with these bacteria from the water used in washing and rinsing the pails, cans and other milking vessels. This sugests at once that these milking vessels should be thoroughly sterilized before used. To do this they should be subjected for some minutes to live steam or to absolutely boiling water—simply hot water is not enough—it must be boiling. Pour into the can and then cover and allow the steam to kill everything that has life that may be in the seams or on the sides of the vessel.

Another source is in the stagnant pools in which cows love to wade and the grass and weeds through which they travel. In this case, bacteria get upon the legs and upon the udder and flanks of the cows and during the process of milking some of them are dislodged and fall into the milk, where they rapidly multiply and in time produce a stringy character of the milk or cream.

Still another source may be in the dust of the stable which falling into the milk pails seeds the milk with the offensive bacteria.

In either of these cases the remedy is, of course, to avoid the cause. Brush the udders and flanks of the cows before milking and then dampen them so that the loose hair and clinging dirt will not fall into the pail.

It is sometimes the case that only one cow in the herd produces milk of this objectionable character, but mixing it with the herd milk seeds the whole mess with these bacteria. It would therefore be an excellent plan to keep each cow's milk separate for a day or two and thus a certain whether one or two or mo of the cows are responsible for t trouble, and if they are, take speci pains to prevent anything fallin from their udders or flanks into th milk pails.—Hoard's Dairyman.

# Profit in the Poultry Yard

**We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.**

## WORMS IN POULTRY.

By Mrs. Frank Metcalf.

IT seems that worms are very much more troublesome on the Coast than in the East; That is, certain kinds are; Gape-worm, which depopulates so many eastern hen-houses, is practically unknown here, but the intestinal worms abound, and especially the round worm.

### Round Worms.

This round worm varies in size from one-third to five or more inches in length, and its color is white. The head is pointed and the tail blunt.

While a few will make no very noticeable impression upon the health of the bird, many of them will cause serious disturbance, and even death. One lady reported having lost a flock of 250 fine chicks in a single season from this cause alone.

They mass themselves in the intestines and by their wiggling sometimes cause a stoppage. Generally the irritation sets up a diarrhoea, and as they eat the nutriment intended for the fowls' support, the affected bird becomes thin, has indigestion, pale comb and wattles, and a general appearance of distress. There are many worm medicines advertised for poultry which may be perfectly efficacious, but santonine is safe and sure. If you suspect worms, dissolve in the water to be used for mixing mash, two grains of santonine for each mature bird, or one grain for each chick to be treated. Mix just enough mash to be all eaten at one feed, quite dry, then add one-half teaspoon castor oil for each bird, (one-half of this for small ones). Try to collect all droppings and burn, or put out of reach of the fowls somenow. To this end it would be best to confine the fowls for a day or two after treatment.

This is not so comon as the round worm, but still some times found, and is identical with the tapeworm found in cats (Toenia crassicolis) and is supposed to be obtained from the liver of the mouse or, to be more exact, the fluke of the liver of the mouse. Chickens will catch and eat mice, as is well known, and the presence of a tapeworm will affect the fowl much as it does in human cases. Voracious appetite, but thin in flesh, and tape worm never suspected unless pieces happen to be noticed, like narrow tape, in the droppings.

In case tape worm is suspected, or proven, give the bird six drops of the oil of male fern in one teaspoon of castor oil in the morning while the crop and gizzard are empty, and if the supper was omitted, so much the better. Feed nothing for two hours dose, then give a light mash in which one teaspoon of castor oil is well mixed. This mash should be warm. A tapeworm three feet long has been voided by a hen, and the worm preserved in alcohol presented to the Reliable Poultry Journal, complete, head and all.

[redacted]he hen lost flesh, grew weaker [redacted] weaker, but had no cold or dis[redacted] that owner could discover. Finally suspecting worms, he starved her for thirty-six hours, then gave a stewed garlic feed, all she could eat, cut in short length. She ate heartily of this, and next day the worm was expelled. Hen recovered completely.

### Thread Worms.

Then there is the thread worm, which affects the lungs of hogs, and which sometimes affects poultry, and causes choking and sudden death resembling apoplexy. The affected animal trying to eat, all at once falls back, struggles a moment or two and dies, apparently in perfect health. This worm is said to be in the ground around old hog pens, and only a change to new ground will insure the rest of the flock from infection. If the lungs are examined a mass of wriggling white threads from one to three inches in length will be seen, so fine that the naked eye can scarcely see them yet so numerous as to cause the tissues of the lungs to be dark and inflamed, and death may be caused by consequent hemorrhage, or simply the choking caused by the irritation these masses set up.

No remedy has been found effectual for this pest, save and excepting to move the living stock to fresh soil.

## CHICKEN POX.

So many are asking what makes the sores on their chicks' heads, resembling warts, sometimes with yellow pus, forming dry scabs, which make the poor fowls present a woeful appearance, and if left unchecked, causes death. This is chicken pox, and the cause is said to be (one cause, anyway) the female flea, which buries itself in the soft, fleshy parts of the fowls' heads, and the sore ensues. Young turkeys are especially liable to this trouble, and close examination will reveal dozens of little black fleas, sticking tightly to the heads around the eyes, the ears, under the bills and on top of the heads. The head should be immediately and thoroughly greased with vaseline which has been melted and ten drops of carbolic acid to the ounce, stirred in as it is cooling. A drop or two of spirits of camphor added to the above, in the same manner will make it much more effective, and the treatment should be repeated in a week or ten days, first washing the heads with warm soap suds, using good, pure castile soap, and drying well before applying the ointment.

Scrubbing the house well with hot salt water, at the same time spraying and dousing the floors under the roosts and the yards with hot salt water, is said to be a sure way to drive the fleas from their abiding places. And it certainly is cheap. But it takes a plenty of it, and will help discourage any mites lurking around, as well. We lose sight of the simple home remedies so often, in our search for cures and disinfectants. Salt and water is good for several things. Our home doctor always used it for simple sore throats, as a gargle, and we should sometimes try it for the simpler forms of cold in the heads of our chickens. A warm salt water douche, dipping the head well under until the bird strangles

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90. 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

$2.60 FREE. If you will send us the addresses of ten persons who have any fowls, we will send you, post-paid, our Biddy Booklet and an article worth ten cents, which many say no household should be without. If you will send us twenty-five addresses, we will also send you The Poultry Manual, profusely illustrated, by those high authorities, F. L. Sewell and Ida E. Tilson, a reliable work worth fifty cents, but free to you. For 100 addresses we will also send free, and expressage prepaid, another most useful article which sells in the East at $2. We merely want to send to them, by mail, some advertising matter, but your name will not be mentioned in connection with it in any way.

# West Coast Mill

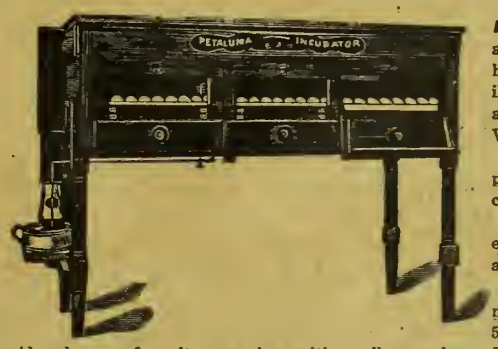
# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators***, besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

might help many a cold, if taken in time. Salt should always be added to their food in some way, or feather eating will result, for the fowls system demands a certain quantity, small in proportion to our own, but urgent, nevertheless. A good sized handful of salt should be added for every twenty-five pounds of dry mash. And the birds will say, "Thank you."—Mrs. Frank Metcalf.

## POULTRY QUERIES.

### Change of Feed.

I have about 125 chickens which includes both hens and roosters, old and young. They run at large all summer, picking their own food. Out of about 80 hens I averaged about fifteen eggs per day. Have had them penned up for 10 days feeding kaffir corn in the morning and soaked barley at night and they have quit laying altogether.—Mrs. I. W., Holtville.

I think the change from free range to close confinement has had something to do with the stoppage of laying, and would suggest a more balanced ration: Suppose you have a long box made, three feet long and eight inches wide and deep, divide it into four compartments, three small ones at one end six inches each, and cut a piece of inch wire mesh just to fit loosely inside each part. Fill one part with oyster shell, one with charcoal, one with good sweet beefscrap and the large one with the following dry mash mixture: Wheat bran 36 pounds, shorts 18 pounds, yellow cornmeal 18 pounds, alfalfa meal 18 pounds, linseed meal 6, and 5 pounds Lee's Egg maker. This must be well mixed by shovelling it back and forth on a smooth floor, or in a large box, then the box kept filled so the hens can have access to it all the time, a water vessel being set near by, so they can drink often while eating. The boxes should be covered with a board which is raised three inches above the box proper by higher end pieces, so as to allow them to eat without wasting the food. The wire netting is placed on top of the mash and follows it on down to the bottom, keeping it from being wasted. These feed boxes should be under shelter, so as not to get damp, or the mash will mold. In addition to this mixture, green food of some kind must be fed daily, cut alfalfa being about the best standby, cut fresh every day, unless lawn clippings are available. The grains should be alternately fed in a litter of straw so as to make them scratch for every grain. If you have no scratching shed hoe up a place in the ground, and bury the grain where they will have to scratch it out to get it. If some sprouts, all the better. A good handful to each crop is about the right amount of grain to feed daily. The above is the way the best laying flock of hens I know of are fed in close confinement. —Mrs. Frank Metcalf.

### Tuberculosis.

One of my hens got sick about a week ago. She seemed to have vertigo, and I treated her for that; when she got no better we killed her. There were rough looking white patches on her skin, mostly between her legs. On the liver, heart and lungs there were white spots as big in circumference as a pea. The lungs were inflamed. The other chickens seem to do well, are active, but do not lay well. Could this be tuberculosis?—Mrs. F. K., El Centro.

I am very much afraid this is tuberculosis of chickens, and that you must remove the remainder to new yards and thoroughly disinfect the house and yard where this hen was running, lest the contagion spread to the others. Also give them a litle olive or codliver oil in their mash food, twice a day for a couple of weeks or more. This with a little tincture of iron in the drinking water, which may as well be given by putting rusty nails in the water as any other way, and plenty of nourishing and easily digested food, of which good American yellow corn should furnish a part, ought to bring them out all right.—Mrs. Frank Metcalf.

### Dry Mash.

I have been buying Creolium and find it just as you state, exactly. I have used the different stock foods and find them very expensive. In your article of July 8th, on the Model plant of Mr. Hammons you say, among other things; feed consisted of grains and green food once a day, and a hopper of dry mash, composed of beef scrap and grains. Will you kindly send me the formula for the dry mash above referred to?—J. W. R.

Regarding dry mash, I have interviewed Mr. Hammons, and he gave me the following formula, which he recommends very highly, stipulating that each ingredient be the best of its kind procurable. As he buys in car lots entirely, and does not hesitate to return anything not just right, he finds that he can feed a hen for a year for $1.20 and keep her in laying condition.

In the first place, one should have a hopper made to hold beef scrap in one compartment, oyster shell in another, charcoal in a third, and the mash proper in the largest compartment. Say one feed box is three feet long and eight inches wide, three small compartments six inches each should be partitioned off for the shell, charcoal and beefscraps, and the rest filled with the mash which is mixed as follows: 2 parts wheat bran, 1 part shorts, 1 part yellow corn, 1 part alfalfa meal, ½ part linseed meal and 5 per cent Lee's Egg-maker. Mix this thoroughly by shovelling it back and forth in a box and measure by weight. Keep the boxes filled, and the hens will only take what beef scrap their system requires, which will be more at some times of the year than at others. All whole grain should be fed in litter to make them scratch, and good sound yellow corn three times a week is what Mr. Hammons recommends the year around. And his hens lay the best of any I know of at the present time.

He gets a daily yield of 42 per cent from his 1100 hens and pullets, and the fertility runs high so that he is taking off almost daily hatches of 80 per cent, having more than the above average of vitality. I think he feeds enough of the grain at night, so that there will be enough left in the litter for the morning meal, which induces early exercise. To be exact in measuring the mash food, say if one wants 100 pounds mixed at once. Get of bran 35 pounds, of alfalfa meal 17 pounds, of yellow corn meal 17 pounds and of shorts 17 pounds, of linseed meal 8½ pounds and 5 pounds of Lee's Egg maker. This makes 99½ pounds of feed in very nearly the right proportions.—Mrs. Frank Metcalf.

### Diseases and Remedies.

I have thoroughbred white rocks and white leghorns crossed. Do they make as healthy fowls as if kept separate? I mixed them for the first time last year. When pullets were seven and eight months old many

**The Cyphers Incubator Pays From the Start**

Begin *right*—whether you are in the chicken business on a large or small scale. Don't "experiment up" to Cyphers quality. Get the best *first*.
The Cyphers means no moisture troubles; no heating troubles; no ventilation troubles. Biggest percentages; healthiest chicks. It's the best by test.

**Phones—F1917, Bdw. 1264**

died suddenly. On dissection their livers were found to be greatly enlarged and spotted. What causes feather eating habit? Some of my young chicks have sore throats, phlegm in throats and high fever. Yellow spots show in their throats. How can I keep it from spreading. When my hens are about one year old their legs get rough and scaly. Is this a disease, and how treated? Some of my hens have dry thick scabs on combs, nose and ears. What is it, and how can it be treated?—Mrs. E. V. S., Glendora.

White Rock and White Leghorn cross ought to be just as healthy as either a thoroughbred Rock or Leghorn, but we can see no gain in a cross of any description. When you cross any breed of thoroughbred fowls you have mongrels, and certainly nothing is more unsightly on a place than a lot of mongrels. Even though they be of one color they will be different shape and size, some with white legs others with yellow, different shaped heads, etc. In fact you will have an unsightly, unsymmetrical job lot.

Your birds have liver trouble, caused by improper feeding, foods which are too rich or too heavy in their proportions of starch and fat-producing elements.

Feather eating is one of the vices that is first caused by improper feeding and lack of exercise. Rarely does the habit exist among fowls that have free range and are fed a balanced ration. The habit will spread from one bird to an entire flock. Separate those that have acquired the habit and feed them liberally fresh meat, feeding them grain ration in a litter and make them work for it, keep your birds busy and you will not have one-half the trouble either with injurious habits and vices or disease.

Your birds have roup—which may be contracted in various ways such as draughts through improperly constructed and ventilated houses, overcrowding, or where fowls and chicks are allowed to roost or crowd together and thus become heated, and afterwards chill when they go out in the cool of the morning. Treatment: Clean up your house and yards, disinfect, find the cause and remove it. For immediate treatment buy some of the roup remedies advertised in our columns and give according to directions.

Scaly leg is caused by a parasite burrowing under the scales of the legs and feet. A few applications of equal parts of kerosene and lard to which a little flowers of sulphur has been added will cure it.

An article on chicken pox was given in our issue for November 25. —F. H. T.

## MATING TURKEYS.

In mating turkeys, it is better to use fair sized, mature hens and a vigorous, medium-sized tom than to depend on securing size by mating a very large tom to undersized and young hens. The latter mating will probably give leggy poults that do not flesh up well while the offspring from the former will be compact and more likely to lay on flesh in breast and thighs. Neither hen nor tom should be under one year of age, and it is desirable that the hen be two years old. In selecting a male bird constitutional vigor is of first importance and it is vital that the birds be unrelated.

In many localities turkeys will be found that have been bred for 30 years or more; the whole flock raised from one pair and with no addition of new blood. The poults will be found undersized, lacking in vigor and nearly imbecilic. The tom should have a good bony frame, round breast and long body and no matter what the hens are he should be pure bred of some of the standard breeds. A young, vigorous, unrelated bird from a long line, bred for certain characteristics will be likely to transmit these characteristics to his progeny.

If the hens are pure bred he should be the same breed, as crosses are likely to show the weak points of both breeds. Many advocate cross breeding to impart vigor, but this is attained just as well by securing birds entirely unrelated. It is usual to allow five or six females to one male and it is not customary for a tom to mate with a hen more than once for one clutch of eggs; one mating being sufficient to fertilize all the eggs laid during the season.—Farm, Stock, and Home.

## CAN THE COCKERELS.

Apropos of the old joke which made California people in the years of a big fruit crop "eat what we can and can what we can't," comes now the serious proposition that we may profitably do the same thing with surplus cockerels—that is, can them. One writes that when his cull cockerels get large enough to suit him he dresses and cans enough to last about a year for his family use. The roosters are cut up, boiled and then packed in two-quart cans, all air spaces being filled with gravy. Then the cans are closed, just as in putting up fruit. This plan has a number of advantages. In the first place, a day or two is given to the job, and it is done for the season. Again one does not have to board the roosters until such a time as they may be wanted to eat, and one has spring chickens the year around. And then, perhaps, the greatest gain is that the chickens are always ready for an emergency. When company comes a half hour or so before dinner, since they began to can chickens, it never worries them.—Fancier.

## ANIMAL FOOD FOR POULTRY.

Bones and meat secured from the butcher and cut into fine pieces by means of a bone cutter are perhaps the best substitute for the insects a hen finds when on free range. Horse meat, being free from tuberculosis is probably slightly preferable to that from the butchers' stalls. Skim milk is a good substitute for meat, but being so bulky the fowls rarely eat enough of it to supply the required nutriment unless it is soured to a clabber and whey drawn off. Dried beef scrap is a product of the packing houses and if of assured quality makes a fair substitute for fresh meat. It should be fed in hoppers and should constitute about 8 or 10 per cent of the grain ration.—Farm, Stock, and Home.

## THE HEN THAT SMILED.

A horrid old hen that ate all the eggs,
Had a terrible appetite, blast her—
It wasn't the hen with the yellow legs
That laid so well for her master.

She whacked at the China egg, peggety peg,
'Twas the hardest she ever had lit on;
Said she, with a smile, "If I can't eat this egg,
I'll save it and keep it to sit on."
—Farm Journal.

# THREE DROPS OF INK

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Belgian Hare Feed.

What is the hest feed for Belgian hares when they have the slobbers?—Mr. Charlie Olson, Armona.

Slobhers are caused by indigestion, usually hy eating too much green food or green food which is wet with, dew or rain or worse yet, is frosted. Withhold green stuff for a few days, feeding dry oats or barley in the morning and dry alfalfa at noon and night, being careful not to overfeed. —B. J. O'M.

### Alfalfa in Young Orchard.

Is it practicable to plant fruit trees then seed ground to alfalfa? Will the trees do well if they are cultivated and kept well watered?—J. W., National City.

It is possible that if sufficient water is applied to keep alfalfa growing and not at the expense of the moisture helonging to the trees, this will be profitahle while the trees are young. It must, however, be borne in mind that the ground around the trees should be kept cultivated so that the air can enter the soil and aid the roots in securing best growth. We would not seed the alfalfa very close to the trees for this reason. It is harely possible that the ground could be left in fully as good condition or hetter by securing a few crops of alfalfa.

### Lost Registry.

Some years ago I hrought with me from my country two Percheron mares. From them I have raised four colts, all from registered Percheron sire, but during these years I have lost the registry of the mares. Can I get these colts registered now? They are full blooded and fine animals.—C. O., Geyserville.

We fear you will he unable to secure registry for these colts. However, we would advise you to get in touch with the Percheron Society of America, Union Stock Yards, Chicago; Percheron Registry Co., Columhus, Ohio; or Breeders and Importers Percheron Registry, Plainfield, Ohio.

### New Plums.

Please tell me where I can secure scions of the Santa Rosa and Gaviota plums you spoke of in issue some months ago. Will they do well here? Are they early or late?—Suhscriber, Auburn.

Scions of these varieties can probably be had of the Fancher Creek Nurseries, Fresno, at least they have the young trees, and where you wish scions to graft over peach trees it is possible they may he secured. The fruit ripens about the first of August. Whether or not these varieties will do well in your community can only be determined by actual test, but so far as we have learned they have proven valuable wherever planted.

### Gum Disease.

My seven year old orange trees pruned in June and fertilized with stable manure are in fine condition on medium heavy soil, but a few of them, less than five per cent, show spots of soft gum on the hranches. The bark shows spots of perhaps a half inch in size and gum comes out. In cutting the bark separates from the wood for a short distance around the gum. Sometimes there are only one or two spots and sometimes there are dozens scattered over the branches. In no case is there any gum on the trunks.—R. H., Riverside.

This was referred to the Southern California Pathological Laboratory and Mr. Clayton O. Smith, Assistant Plant Pathologist, answers: "This is probably a light attack of gum disease, for information regarding which see Bulletin issued hy this station. It is probably not a serious attack."

### Keeping Flowers.

I find it impossible to send hy mail such flowers as roses and geraniums. I have tried inserting stems in pieces of potato and also wrapping in wet packing, but with the same result that in three or five days in the mail they are so withered that they will not freshen up in water.—Guy H. Whetstone, Escondido.

We will pass this question on to our suhscribers and hope that amongst them may be some who can give our inquirer the information he desires. As a suggestion we might ask whether the packing was arranged so that the flowers could have air as well as moisture. We imagine that is one trouble with sending flowers through the mail. There are methods of dipping orange blossoms in wax and other methods of preserving flowers, hints on which we will appreciate from our readers.

### Dried Olives.

In your issue of Septemher 23rd you give recipe for curing olives, and the statement is made that drying them takes out the bitterness. I was delighted to learn this and thought it would he fine to serve them in the same way as raisins or figs. As soon as the olives were fully ripe I tried it, first dipping them in lye as we did prunes, but the terrible bitterness remained and no one could eat them. It was suggested that I should not have used the lye and I tried others without the dipping, but with the same result. I have always had confidence in the recipes found in the Cultivator and am anxious to try olives prepared in this way.—N. M. T., Orland.

The recipe referred to was furnished us by Mrs. Carrie Williams of San Diego and we have referred your letter to her and hope she will give us an answer in a later Cultivator. However, we note that the article she wrote formerly says, "The natural bitter of the olive to which some object, evaporates almost entirely during the process of drying and the natural richness and flavor of the fruit are both left instead of being wasted." We have eaten olives prepared in this way and have enjoyed them very much. They are not entirely free of the bitter, but when used in the lunch basket or for picnics are both a relish and a food. Where one has no liking for the hitter at all, he will never perhaps he able to secure satisfactory results by this process. We hope to puhlish more complete information from Mrs. Williams later.

### Almonds for Ventura.

Kindly give information as to most desirable almond to grow in Ventura county 120 miles from the coast at an elevation of 400 feet. Are the French or Italian varieties of chestnuts a success in Southern California? P. W., Ventura.

Any of the commercial varieties of almonds do well in Southern California in situation suitable to almond growing, except I. X. L. It never paid for its cultivation in any of the places I have seen it growing in the San Bernardino Valley. I cannot advise you as to your growing almonds in Ventura county after the general description you give of your location. What you need, is a location free from late frosts with water for irrigation and little or no fog after August and before the middle of October.

Chestnut growing has never been a commercial success in Southern California unless it is in some ohscure place or on a very small scale. The trees do well however.—J. W. M.

### A CORRECTION.

Under cuts of my birds in the Cultivator of Decemher 9th, you have credited my S. C. Red cock, who has never heen in the show room, with being a two year 1st prize winner. I am sorry to say that I do not own that hird. My R. C. cock was the winner those two years.

Kindly make this correction as I only want what belongs to me.—Chas. E. Winslow, Red Feather Poultry Yards, Monrovia.

Covina Citrus Association netted its growers for this season's shipments $365,413. Officers elected for the ensuing year are: C. S. Beardsley, president; J. R. Elliott, vice-president; G. N. Atwood, secretary and manager; First National Bank, treasurer; A. P. Kerchhoff, T. F. Griswold, A. M. Seeley, W. P. Watts, S. T. Berry, J. H. Brubaker, directors.

It is claimed that the Consolidated packers who have been endeavoring to hreak the raisin market, really did offer fancy seeded raisins at 4¾ cents when they were claiming to the growers that the price of 5 cents prevailed.

Farmers near Lewiston, Idaho, report the past season as the biggest ever given to that state.

### THE SPIDER A BENEFIT?

I read with interest the article, "The Spider is a Benefit," in the California Cultivator of Nov. 18. While I agree with most of what was said about the spider in that article, I respectfully differ from the author when he says: "I think there never has been one absolutely authentic case of spider bite." Lest some of your readers should be led by this assertion to handle carelessly certain species of spiders, I will give you my experience during the last summer. One evening in the month of July while I was emptying the contents of a sulphur bag in my barn, a middle-sized black spider crawled up my shoulder. My little boy tried to brush it off, but he missed it, and the spider got into my clothes. Presently I felt a slight sting or bite, and as I felt something moving under my shirt on my breast, I held or crushed the object from the outside, and on undressing, I found the black spider as described above. However, I got through my evening work without any difficulty, but in an hour's time I began to feel a peculiar sensation all over my body, a certain drowsiness came over me; I felt sleepy without being able to sleep. This feeling gradually gave place to strange painful sensations in different parts of my body, now my head, now my back, and so on. In about three hours' time I was suffering excruciating pain all over my body from head to foot. I tried various home remedies but to no purpose. The next morning I obtained medical aid, but still those terrible pains continued for three nights without a moment's rest. The spot stung by the spider had gradually become very red and the redness had a tendency to spread, and I had to keep this under control by a constant application of a lotion prescribed by my physician. I have been stung once by a scorpion and many times by bees and wasps, but I would rather be stung by all these three every day than by a black spider again.

I trust your correspondent will note at least this "one absolutely authentic case of spider bite." In the next place, as to the spiders being all benefactors of mankind, what about those minute red spiders which infest our orchards and at times destroy acres of trees? No insect that I know of does more damage to trees than this insignificant, almost invisible little spider.—T. I. Ambarch.

# Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ No. Broadway, Los Angeles.

Mr. Payne writes:

"I owe the Cultivator and those who have made inquiries concerning legal questions, an apology, as I have been unable to answer queries for a number of weeks on account of the sickness and death of my associate in the law business, and the consequent loss of time, and rush of business, which has been very heavy, but enclosed find answers to the queries that have accumulated, and I hope to be able to give a little more time to queries in the future."

### Homestead Rights.

Can a man homestead government land when his wife now owns a quarter section secured under homestead rights? If she has secured it by purchase, would that affect his right of homestead?

If the wife secured her homestead by purchase and not from the Government, I know of no reason why the husband may not enter a homestead. The statutes of the United States, however, prohibit both husband and wife from homesteading, although the wife, if deserted, and the head of the family, may homestead or may complete her husband's entry, if he has abandoned the same. If the two are living together as husband and wife, the fact that the wife in her own right owns property, whether a homestead or not, I think would make no difference as to the husband's rights of entry.

### Entitled to Damages.

In April last I had a pipe line 300 feet long. Two days after it was finished, I turned about ten thousand gallons of water into it, which water nearly all ran out through 36 holes where the joints were badly cemented. Since then the contractors have tried to mend it several times but everytime I turned the water in, a large quantity ran out through holes, so that I lost my alfalfa, as I was short of water. They have been mending it for nearly seven months, and there are still four leaks in it. My loss has been great, as I needed this alfalfa for my 2,000 hens, am I fairly entitled to damages?—A. M. J.

Your are entitled to damages, as the contractors should have done the work in a good and workmanlike manner, using proper material for that purpose.

### Public Nuisance.

If A builds a house within ten feet of the line between him and B and afterwards B devotes his entire lot to chicken and cow corrals, the line fence between A and B is 13 feet from A's house; which house is six feet above B's lot.

If said corral should be kept as clean as possible, would the fact that the corral is a corral and deters people from buying or renting the property adjacent to it, constitute a public nuisance?—L. B.

No, the facts set forth in the inquiry do not show a public nuisance, and not even a private nuisance, but if the proximity of the corral, and the manner in which it is kept, endanger the health of the adjacent resident, it might possibly be abated as a private nuisance. If, within the city limits, where ordinances prevail concerning such matters, the situation should be dealt with under such ordinances.

### Assessment Statements.

Does a tax payer have to go to the assessor to give in his property or has the assesor to go to the tax payer to get his list? Has the tax payer a right to place the value of personal property. For instance, A has a team worth $500, B has a team worth $300, should B pay same tax as A does? If B should refuse to sign tax list what would be result?—A Subscriber.

All taxable property must be assessed at its full cash value according to law, but custom has superceded the letter of the law, and as every one knows, property is not assessed at its full cash value. The assessor must exact from each person a statement under oath setting forth specifically all the real and personal property owned by such person, or in his possession, or under his control, at 12 M on the first Monday in March; such statement shall be in writing, and in the form familiar to every tax payer. The assessor has power to require such statement to be verified by an affidavit, which should be done in all cases. If any person, after demand made by the assessor, neglects or refuses to give under oath the statement mentioned, the assessor must transmit, on or before the first day of July of each year, to the Board of Supervisors, a list of all persons who refuse or neglect to furnish a statement of their property; a statement of the assessment upon the property and the facts upon which the assessment has been based, and the valuation of the property, so assessed, ascertained. The assessor must make an estimate of the value of such property of such person, that estimate is transmitted to the Board of Supervisors. The Board of Supervisors should make a demand upon the party refusing to furnish statement as aforesaid, and require him to deliver his statement to the Board of Supervisors, and should he fail to do so, they must increase his assessment to such an amount as they shall deem just, such amount, however, shall not be less than that fixed by the assessor.

### Trees on Line.

There is a row of trees on the line between my ranch and the next one. I want to cut down the trees and my neighbor don't want to. Have I the right to cut down every other tree or do I have to leave them as they are? —J. H., Oxnard.

You have no right to cut any of them as they all belong to you and neighbor in common, and each has as much right in every other tree as in any tree in the row.

### Trades a Horse.

If a father buys a horse for his son who is 17 years of age, and the son trades the horse without the father's consent, does the trade stand good or can the father compel the other man to trade back, and would he have to pay the cost?—Subscriber.

The parent, as such, has no control over the property of the child. In order to control the property of

child (and in this particular instance, the horse mentioned) the parent should be appointed guardian of the estate of the child, and then no sale would be valid unless made by the guardian. The sale of the horse by the minor would be good if fairly made, there being no guardian.

### Planting Trees in Road.

I wish to set along my line-fence "which is on the county road line," some palms and eucalyptus trees. Now how far from my line-fence toward the center of the road will the law allow me to set the above named shrubbery.—A Fresno Co. Subscriber.

The County has an easement over the entire width of the county road for road purposes, and in the absence of a special privilege granted to you for that purpose, you have no right to place any trees or other obstructions in the road.

### Who Bears the Expense.

A street or road, runs between the land to be irrigated, necessitating a bridge across the street in order to bring the water on the land. Whose duty is it to build the bridge, which is used for the public, the land owner, or the water company?—F.

It is the duty of the one, who has control and management of the ditch, to build the bridge. It is impossible to say, from the facts furnished in the foregoing inquiry, whether it is the duty of the Water Company to deliver the water at the land of the owner, or whether the Water Company has fulfilled its obligation by delivering the water across the road or at some other point, therefore, it is impossible to answer the question, except in a general way as above. It might be the duty of the County, under certain circumstances, to build the bridge.

### Trees on Line.

Is there a state law against planting eucalyptus trees on the line? If a deed to property gives boundaries in feet and the fence encloses forty feet less on one side, does the fence or the boundary given in the deed prevail?—M. G., San Diego.

I know of no law preventing the planting of eucalyptus trees on the property line.

Monuments, when permanent and visible and inconsistent with the measurement, either of lines, angles or surfaces, are paramount, and the grantee would take in accordance with the monuments rather than the number of feet specified. If the fence was not mentioned in your description, and therefore, there is no inconsistency in the description, I know of no reason why you should not take in accordance with the description as given in feet.

### A FAMOUS HARNESS BLACKING.

The famous English harness blacking is made as follows: Three ounces of turpentine and two ounces of white wax are dissolved together over a slow fire. Then add one ounce of ivory black and one dram of indigo well pulverized and mix together. When the wax and turpentine are dissolved, add the ivory black and indigo and stir until solid. Apply thin. Wash afterward, and you will have a beautiful polish. This blacking keeps the harness soft and is excellent for harness and buggy tops.

Big reductions in freight rates on the Southern Pacific to all points west of El Paso will go into effect on Jan. 2.

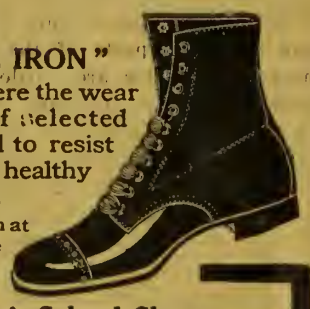
Mayer Special Merit SCHOOL SHOES

"WEAR LIKE IRON"

They wear best where the wear is hardest. Made of selected leather specially tanned to resist exactly the kind of wear a healthy boy or girl will give them.

Two layers of leather are sewed in at the tip instead of one, to prevent the toes kicking out. The soles are of extreme toughness.



Mayer Special Merit School Shoes

are made to fit a child's foot in a comfortable, natural way that will prevent foot trouble in later years, yet they are stylish and good looking. Only the genuine have the Mayer Trade Mark stamped on the sole.

FREE—If you will send us the name of a dealer who **does not** handle Special Merit School Shoes, we will send you, free, postpaid, a handsome picture, size 15x20, of George Washington.

We also make Honorbilt Shoes for men, Leading Lady Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Work Shoes.

## CALIFORNIA, MY OWN.

California, smiling ever,
With the sunshine on thy breast,
Is there elsewhere crest or valley
That could woo my heart to rest?
For thy shores and murmuring forests,
For thy plains in gardens sown,
For thy loveliness I keep thee,
California, my own!

Like a child in restive pastime,
I have wandered here and there.
Memory's hall is filled with pictures—
Treasures in a house of care—
Cedars, canons, hillsides blooming
To my wond'ring spirit shown.
What can rob me of thy wood paths,
California, my own!
Clearer than the sheen of jewels
Is the brightness of thy spring,
When among the orange blossoms
Tiny warblers flit and sing.
Oft I linger on thy beaches
When the summer days have flown
For thy winter's gentle weeping,
California, my own!

Dost thou love me, California?
Why these tender skies of blue?
Why the blessing of the west wind?
Why the March flowers wet with dew?
Why the golden poppy mantle
O'er the drowsy upland thrown?
Why the comforting of thrushes,
California, my own?

In the temples of the mountains
Came confession from my soul,
And the white-stoled falling waters
Have pronounced my spirit whole,
When my dust is 'neath thy grasses
And I pass to God's unknown,
I shall cherish thee forever,
California, my own!
—Lillian Hinman Shuey, in San Jose Times.

## THE KEY TO A MAN'S HEART.

A LITTLE old locksmith, who was also a genii, sat at his bench, working diligently, when the door opened and a breathless woman entered.

"I am about to take possession of a new dwelling—a man's heart," she explained. "Those who have lived in it before have carried off the keys. But you will be able to fit me out, will you not?"

"What kind of a place is it?" asked the accommodating little locksmith.

"A rather conventional house,, large and sunny and commodious," she replied. "There are no mysterious passages about it, and no blind doors. The locks ought to be easily fitted, although some of them have grown rusty from disuse, and a few of the doors have never even been opened."

"It is sometimes so with a house," commented he.

The woman nodded. "But I could never be happy living in a part of any house," said she. "I must occupy it completely."

The locksmith took down his great key-rings without answering.

"Now this," said he, holding out a key to her, "is the first you will need. It opens the outer door of the house into the vestibule of interest."

"Oh," she said, with a little laugh, "that is already open. I shall not need that key."

He gave her another to the wide central hall of confidence, and she took it, glad to get it, of course, but without great enthusiasm, and hung it on her girdle.

"And this is the key to the living room of comradeship," he went on "That, I suppose, is a large west-facing apartment, with plenty of windows and a good fireplace. It is usually the most cheerful and the most comfortable room in a house."

"Perhaps," said the woman. "I shall sit there a great deal, I am sure," and she slipped the key carefully in place.

The locksmith selected another from one of the rings.

"This fits the lock on the door of the room of constancy," said he.

"I'm afraid that room has been rather neglected," she said, with a charming little grimace, "but I shall look after it at once."

The locksmith's eyelid flickered at the way the red bow of her lips straightened into a thin line.

Then he gave her other keys, little and big, naming them as he gave them, and she hung them one by one upon her girdle.

"But," said she, when he would have put the key rings away at last, "you have given me none for the unused rooms of which I told you."

He hesitated, fingered the keys on a small ring which he had not yet touched. "You are certain you wish them?" he asked.

"Above all the others!"

"Oh, very well," said he, and dropped into her palm two slender keys of beaten gold.

"Now, said she triumphantly, with a sigh of relief, "I shall go where I please!"

And she went away, her girdle weighted with the keys as the stomacher of Cleopatra with its jeweles.

Days afters she came back, so radiant that her beauty made the eyes of the little old locksmith blink as they always did when the sun, catching them wide open, would flash his smile straight into them.

"Well?" interrogated he of her.

"They fit!" she cried. "Every key turns its lock like magic! It is quite wonderful, is it not?"

"By no means," he repied. "You are a very clever woman and I am a locksmith and genii. Between us we should be able to accompish most things."

The woman's answering smile was vague. "There is—something else," said she. "I need still another key."

"Bless me! What key is that "

A shade of annoyance lay over her lifted eyes like the dapple of shadow over a pool.

"There is a little closed room in the rear of the house that I did not notice just at first," said she. "It is a dark inner room, but I must get in."

"Do you need it?" asked he. "Are there not enough rooms without it?"

"It is not that I need it," she answered, "but that it mocks me with its closed door. I have looked in at the keyhole and can see nothing but dust and shadows and cobwebs. But I am sure there is something else there."

"The room of the past," murmured he. "Yes," she nodded, "and I must turn the lock.

"Why he asked. "Why must you?"

She flushed, and her eyes fell. Then she lifted them defiantly.

"It is my house, is it not? Besides, it needs air and light."

The wise little locksmith smiled

curiously; and the woman's color deepened beneath the smile.

"It is not curiosity that urges me," she flamed, as if he had accused her. "The whole house has need of my care."

He shook his head.

"Leave the room closed," said he.

But she held out her hand peremptorily.

"Give me the key for it," she commanded.

"There is none in the shop that will fit that lock."

"Make one, then."

"I could not if I would."

"What shall I do?" she cried.

"The man has a key. Ask him for it, if you must."

She smiled at him in quivering disdain.

"Surely there must be a duplicate somewhere," she urged.

"There is none," said he.

She stared at him in amazement.

"You mean that you can not help me to get in there?" she demanded.

The locksmith made her his profoundest curtesy.

"Madam," said he, "there are things which even you and I can not do with all our cleverness and skill."—Smart Set.

A MOUNTAIN STREAM.

### TRIED RECIPES.

The following recipes have been sent to the Cultivator's household department by Mrs. G. A. Swann of Imperial. They certainly look good and will be appreciated by Cultivator readers.

**Prince of Wales Layer Cake.**

Butter size of an egg, 1 cup brown sugar, 2 tablespoons molasses, 2 eggs (1 will do), ½ cup sour milk, 1 teaspoon cinnamon, a little nutmeg, 1 cup raisins brought to boil and taken out of water and floured. Spread cake with icing of any sort.

**Mocha Icing.**

One heaping cup pulverized sugar, ¼ cup butter, 2 heaping teaspoons cocoa, 1 teaspoon vanilla. Rub well and add enough strong coffee—about 2 teaspoons—to make the right consistency. Do not cook.

For the sake of economy in eggs just now I find that I can use corn starch to partly take their place. For instance I make a salad dressing as follows:

**Salad Dressing.**

One tablespoon butter, 2 tablespons sugar, ½ tablespoon mustard, ½ cup vinegar, ½ cup water (boiling), 1½ tablespoons corn starch, 1 egg. Mix together all ingredients, but egg and water. Then gradually add boiling water and last the beaten egg. The addition of thick cream sweet or sour improves it.

To make a very large custard pie, if one dessert spoon of corn starch is added, one egg will be sufficient. Cakes in shape of sweet biscuits may be made without eggs, using 4 cups flour, 2 cups or less of sugar, 1½ cup sweet soft dripping, currants to taste, or seedless raisins. Cut in small biscuit shape and bake.

### SELECTION AND PREPARATION OF MEAT.

Probably no part of the daily expenditure for food requires as much thought as the purchase of meat, for meat is expensive, and the difference in price of the different cuts is not always a guide to the difference in food values. Every housekeeper should make a careful study of a good meat chart and learn the location of the various cuts.

Meat is the name applied to the flesh of all animals used for food.

Beef is the meat of the steer or cow, and is the most largely consumed of all animal foods.

Veal is the meat obtained from the young calf. Veal should be thoroughly cooked. It is deficient in fat and has not much flavor; therefore, it is advisable to season it well and to add salt pork while cooking. Good veal is pink in color and has white fat.

Beef is digested easily, and a healthy stomach will digest it without any trouble.

Meat is comprised of fat, mineral matter, water, and protein. There is about four times as much protein in a pound of meat as there is in a pound of milk. The color of meat comes from the matter which is found in the red corpuscles of the blood.

The most expensive cuts of meat come from the parts of the animal where the muscles are little used. These cuts are tender, fine grained and of a good flavor. On the other hand, those parts much used produce tougher cuts, but they are often very juicy and of fine flavor if properly cooked. The tough meat forms more than half the animal, but is just as nutritious as tender meat. While, in many cases, the tender cuts are desirable and preferable for people who have a large income, the cheaper cuts may be used to better advantage if well cooked.

At the Colorado Agricultural College, the students are shown how to cook a cheap piece of meat so that it is nutritious, palatable and attractive enough to put on the rich man's table.—MARY F. RAUSH, Colorado Agricultural College.

### TREATING SWEATER NECKS.

If the neck of a sweater becomes stretched too wide from wearing, do not sew up or cut out any of it; simply dip neck part in clear warm water, wring out lightly, and hang up to dry. The neck will, when dry, have resumed its original shape and size.—Woman's Home Companion for December.

### LIKE FATHER, LIKE SON.

"Does your son profit by your example?"

"Thunder, no! Why, he wants to get married!"—New York Herald.

### HE KNEW.

"Dad, what sort of a bureau is a matrimonial bureau?"

"Oh, a bureau that has five drawers full of women's fixings and one man's tie in it."—Houston Post.

### PROMPT ACTION.

Anxious Friend—Gayman, you ought to do something for that uncontrollable thirst of yours, and you ought to do it quick.

Gayman (putting on his hat)—I'm ready to go and join you in one right now, old chap.—Chicago Tribune.

Also makers of "ENTERPRISE" Bone, Shell and Corn Mills, Sausage Stuffers and Lard Presses, Coffee Mills, Raisin Seeders, Fruit, Wine and Jelly Presses, Cherry Stoners, Cold Handle Sad Irons, etc.

The "ENTERPRISING HOUSEKEEPER" contains over 200 recipes. Sent anywhere for 4 cents in stamps.

**The Enterprise Mfg. Co. of Pa., Dept. 55 Philadelphia, Pa.**

Look for name "ENTERPRISE" on machine you buy.

### BEDROOM DECORATION.

To one who loves neatness and order and daintiness, bedroom decoration is as important as parlor decoration. In the bedroom there should be few ornaments and little furniture. There should be no carpet to make a dust when swept and to catch germs and make frequent moppings impossible. Of course an oiled hardwood is best and most easily cared for; but where one cannot afford that, a painted softwood floor or an oilcloth, or even a bare softwood floor is better than a carpet. There may be a few rugs. If one cannot afford better, bright colored rag rugs are nice. They may be braided, crocheted, woven or drawn.

For curtains, dotted curtain muslin is nice. The curtains may be made pretty by being ruffled, or plain and hemstitched with hems three-fourths or one inch wide. Such curtains are easily laundered and do not shut out much light.

The bedrooms should be as light as possible. Germs love dark places, and the bedroom window should be open all night and all the year 'round. In winter, quite a narrow opening may suffice, but unless you wish to poison yourself, have headaches, etc., do not sleep with windows closed. Sleep in a close room does one very little good. And remember, cold air is not necessarily pure air.

But to return to my subject. The bed should not be placed with its side against the wall so one must sleep with one's head in a corner. If the bed is out from the wall one gets more air and finds the bed easier to make.

People should not have too many covers on the bed. It seems to sap one's strength, especially when warm weather is coming in the spring. Some have quilts outside. Is it not best to have a washable cover? If one cannot have bedspreads, some other cheap, thin, washable cover should be used. It is not easy to launder quilts, and if you wish to sit on the bed, do not turn the spread back. Its use is to keep the heavier covers clean.

Iron bedsteads are neatest and look best, but we farmer folks often have to content ourselves for the present with what we have. Any bedstead that can be kept clean and can be moved around will do. For bureau scarfs, splashers, etc., shrunk cotton (at about 12½ or 15 cents a yard) double-hemstitched is neat and pretty, or, a nice washstand cover may be made of any rather thin white cotton with a ruffle around the edges, the whole thing, ruffle and all, to just cover the stand. A plain cover should be longer and have quite long ends to hang over the edge.

There should be no useless ornaments to catch the dust. The few pictures should be restful and homelike. A girl should avoid lumbering the room with fancy pin-cushions and all sorts of little trifles that some girls like. On the toilet table, commode or whatever one has beside the washstand, the only necessary things would be a hairpin holder; a pin cushion, or pin tray; comb-and-brush box, and perhaps a handkerchief box. One could have a hair receiver (for combings) hung over it and a match safe. These things will make it easy to always have the room tidy. It is well to have a little laundry bag hung in an inconspicuous place.

The walls are best painted so they may be easily washed. If this is not possible, calcimining in some nice color makes them pretty and is cheap. If paper is used (and this is not so sanitary), do not have large or intricate figures. The plainer the better. Before choosing the paper, think what color you would most desire to have for a long time. Pink, red, or blue are the colors least desirable, probably.

Almost any shade of brown, green or gold figures are prettier.

For a girl's room a shirt-waist box is very handy and makes an excellent seat. With these things and a few chairs, a bedroom has all it needs, and its chief beauty should lie in its neatness and order. To be best, one's room should be as plain, fresh, light, and airy as a hospital. So it is restful and very easy to care for.—Farm, Stock and Home.

### HANDKERCHIEFS FOR CHILDREN

In this day of cheap handerchiefs, and cheaper material for making them, any mother can supply her children with plenty of nice handkerchiefs, and a lot of them can be made from parts of wornout summer dresses and from scraps of any old or new thin, soft material. One mother bought some remnants of cheap figured lawn and put them in strong suds and boiled the color out, then they were cut in squares of the desired size and hemmed on the machine.

Give every child a handkerchief box where they can find a clean one every day, for there is no better way to teach children to be dainty and neat than by teaching them to take care of their small belongings, and they should be taught that a soiled handkerchief should never be paraded in public.

If one of the children is suffering with a cold in the head, his handkerchiefs should be kept to themselves and great care taken in their cleansing, for a cold should be treated as a distinct though of course a mildly, contagious disease. A good way to clean the hadnkerchiefs without hard rubbing and to disinfect them is to pour warm water over them and let them stand for an hour, then pour off this water and place them under water in which a tablespoon of coal oil has been stirred and let them remain over night. The oil tends to whiten them and will not injure the fabric in the least and then it removes all stains. In the morning prepare warm suds by stirring enough pearline in the water, then put in the handkerchiefs, let them stand awhile and they are ready to be washed and rinsed.

Nice handkerchiefs washed in this way will come out as white as new ones, but this treatment is especially good for the very soiled articles, and they don't need to be boiled if they are put in a basin after washing and rinsing and boiling hot water poured over them. When the children have very bad colds, give them small pieces of old soft cloth to use as handkerchiefs, and burn these after using, as this may prevent the spread of the disease among the children.—A. M. H.

"For every evil under the sun,
There's a remedy or there's none,
If there be one, try to find it,
If there is none, never mind it."

## THOUGHTS ON DIVERSIFIED FARMING IN TULARE COUNTY.

**Address By Thos. Jacobs of Visalia at Dinuba Farmers' Institute.**

TULARE COUNTY has almost abandoned the special lines of farming so common only a few years ago. Then the country was devoted to grain and stock. Immense grain fields stretched for many miles along the eastern foothills and well out into the plains. These were surrounded by or included in immense cattle ranges. Wheat and barley, together with stock consisting of cattle, sheep and horses were about all that could be found here, but later diversified farming began to take the place of the specialties that had been thought by many to be the only things that Tulare county could produce in commercial quantities.

Settlers from other parts of the State and country began to come into the county and to these largely is due the change that has taken place.

Fruit growing in all its branches yields wonderful results. Vegetables of almost every kind do well. Dairying and poultry raising came in for a fair share of attention until today the county, instead of being given over to the jack rabbit, coyote and cattle, is the veritable land of promise. The promise of milk and wine and honey is more than fulfilled for these are only a small part of the new order of things.

Nearly every tree and plant, fruit or vine of the temperate and semi-tropical zones is now found growing to perfection on some of the many farms of the county. Thinking men and women have also taken hold of the stock industry and instead of the long horned cattle and shaggy mustang, we see that queen of the dairy, the sleek little Jersey. The noble Shorthorn, the heavy white headed Hereford and the blocky Polled Angus, all money makers in their class, while the Percherons, Shires, Coach and other breeds of the horse have almost supplanted the rough little mustang.

Sheep and swine have not been forgotten and today we can point with pride to many herds that challenge the admiration of the older settled sections of the country. Poultry is another important item in the present system.

Instead of the old time ranch house usually a mere shack, and its nearby corral and sheds, where the old time specialist thought his land was doing pretty well if it produced enough to supply the absolute needs of the family and himself, now as a result of diversified farming, we have the cozy cottage or more pretentious home surrounded with shade trees, vines and flowers, supplied with all the necessities and many of the luxuries. A few acres in many cases bring in far better returns than did the big ranch when devoted to grain and stock.

Last year at the Exeter Citrus Fair the Dinuba district made an exhibit of the products of the soil comprising about everything under the sun. What can be accomplished in the Dinuba district can be done in other parts of the county just as well.

The changed conditions call for more thought, perhaps more work, on the part of the farmer, but the results justify it. In the days gone by when the stockman and grain rancher occupied the country, there was a demand for labor only during the seed and harvest, the rest of the time the country was almost deserted. Under the present system of farming there is an almost continuous seed time and harvest and as a result there is a constant demand for labor. With the change in farming have come big changes in the economic and social condition. The great ranches have been subdivided and in place of one family (that were seldom at home on the farm) together with a few cow punchers and mule drivers, we now have many families permanently located, surrounded with good schools, churches, and other requirements of modern society.

The Farmers Institutes, the Grange agricultural societies and clubs, all help to draw the farmers closer together for an exchange of ideas and instruction. Here they can compare notes on the many points of interest that are constantly coming up, such as soils, water, drainage, fertilizers, etc.

To sum up: In the short space of 25 or 30 years Tulare county has demonstrated that it is not only adapted to stock and grain, but that we can raise as good as or better potatoes than Ireland, raisins as good as Spain, prunes as France, and oranges as the world, and nearly all kinds of vegetables and small fruit equal to the best, and the end is not yet. Mr. Luther Burbank is credited with the claim that not over one per cent of the natural resources of the country has ever been developed. If this applies to Tulare county, what may we not expect of its future development.

To every farmer man or woman I would say attend the Farmers Institutes, join the Grange, become an active worker mentally and socially as well as physicially to the end that we may all do our part towards making Tulare county the peer of, if not the model farming county of the state.

---

Redlands horticulturists received new points on treatment of gum diseases at a lecture last week by J. A. Lehman, a graduate of the Agricultural University of Belgium. Mr. Lehman is doing practical orchard work in treating citrus trees in San Bernardino county.

**Over 1300 Fireless Brooders Sold Since Mar. 1st**

We Pay Freight

Sold on Free Trial and not a single brooder has been sent back. These brooders are a positive Success. We sell them at the lowest price any fireless brooder is sold at. We can ship chicks safely in them anywhere within 40 hours. Send today for catalogue and price list. We make two sizes, 75 and 150, prices $3 and $5. Also make Out door styles of Fireless brooders at $7. We pay the freight write today for catalog.

**E. E. McClanahan** 112 East Eighth St. Los Angeles, Cal.

**Farmers, Take Notice**

To increase your crop in quantity and quality you must fertilize. The Tom Lewis fertilizer insures big crops for everything that grows. The best and cheapest fertilizer made. It is the farmers' money maker. No trouble to use. Big crops are sure to follow. This fertilizer produces 6 to 10 pounds of grapes to the bunch. For catalogue and prices write.

| Shorts | 31.50@33.00 |

## Citrus Market

LOS ANGELES, Dec. 15, 1909.

Probably over eighty per cent of the fruit of Tulare county and Butte county has been forwarded. It is being received exceptionally well in all the eastern markets. The only objection which has been raised to it since it has become fully ripened has been as to its size. It is running exceptionally large sizes all over the state. But few of Southern California houses have opened and will not open until after the first of January.

Lemon shipments are very light but prices are exceptional. Market very strong with every promise that it will remain so.

**Shipments.**

Total shipments of citrus fruit from Southern California points to date aggregate 894 cars, of which 516 were oranges and 378 lemons. To same date last year 1116 cars, of which 631 were oranges and 485 lemons. Tulare county and vicinity shipped to date this season 1750 cars, all oranges. No definite report received from Butte county, but less than twenty per cent of its fruit remains on the tree.

---

CINCINNATI, Dec. 10.—Cold; market is weak. Ten cars oranges sold. Florida Brights 1.35@1.80; Russets 1.35 @ 1.70.

---

PITTSBURG, Dec. 10.—Two cars sold; prices low on navels on account condition; market strong on lemons. Six cars Florida oranges sold, average $1.55. Market steady on Floridas; cold.

| LEMONS— | Avge |
|---|---|
| Lemoncove, TCC Ex, Lemoncove | $4.10 |
| Justasgood | 3.95 |

---

BOSTON, Dec. 10.—Four cars sold; weather cold; market doing better on oranges; very strong on lemons.

| LEMONS— | Avge. |
|---|---|
| Pet, S A Ex, | $4.80 |
| Greyhound | $4.30 |
| Protection, Fy, Ohio Lemon Co. | $4.50 |
| Clubhouse | $4.15 |
| NAVELS— | Avge. |
| Blue Labels, X F | $2.55 |
| Mariposa Fy, Cal. Cit. Union | $2.30 |

---

ST. LOUIS, Dec. 10.—Colder; market advancing. Nine cars sold. Floridas, $1.60 to $2.25.

| NAVELS— | Avge. |
|---|---|
| Bear and Eagle, TCC, Lindsay | $2.10 |
| Mt. Whitney, TCC Ex. Porterville | $2.35 |
| Rainbow | $2.15 |

---

PHILADELPHIA, Dec. 10.—Market steady; weather cold; 6500 boxes Floridas sold, $1.40 to $3.20; average $1.75; 7000 boxes grapefruit, $1.95 average. Tangerines $1.60.

---

CLEVELAND, Dec. 10.—One car navel oranges and one car lemons sold. Market higher, both navels and lemons; cold; snowing.

| LEMONS— | Avge. |
|---|---|
| St. Leffingwell, XXX brand, | $4.45 |
| EEE brand | $4.35 |
| NAVELS— | Avge. |
| Tulip, T T C Ex, Porterville | $2.70 |
| Oakleaf | $2.40 |
| Seedless brand | $2.35 |

---

NEW YORK CITY, Dec. 10.—No sale of California citrus fruit here today.

NEW YORK, Dec. 13.—One car valencias, one car lemons and five cars navels sold. Market very steady on valencias with an upward tendency. Lemons strong and active. Navels active and advancing on well-colored but pale, unmatured stock moving sluggishly. Cloudy, snow in the morning, rain at noon.

| VALENCIAS— | Avge. |
|---|---|
| Old Mission, Fy Chapman | $6.95 |
| Old Mission, Ch Chapman | 5.85 |
| Golden Eagle, Sd Chapman | 4.00 |
| NAVELS— | Avge. |
| Bowen | $3.10 |
| Vista Robles, Or Hammond Orch. | 2.10 |

| | |
|---|---|

but result in a great growth to the city.

The growing of the timber would not affect the water bearing value of the lands and thus they could be made of double value to the owners and it might be that the timber crop in time would be the more valuable of the two.

Ranchers in the vicinity of the city would do well to plant tracts of eucalyptus, judging from the experience of the city thus far, in forming syndicates for the intelligent cultivation and growing of the timber which in a few years will be most valuable, owing to the rapid disappearance of the forests in the timber-producing districts of the country.—San Bernardino Sun.

## THE BERRY INDUSTRY.

(Continued from Page 608.)

means putting a shovelfull of soil on the tip of the new growth, in the winter, causing it to take root. By spring they are ready to plant. Thorough preparation of the ground and good care afterwards will give the results obtained in all other fruit planting.

tions, fruit unions, farmers unions, fruit exchanges, and so forth. This together with the canneries continually telling us that we were producing more than they could sell only at a low price, infected us with the microbe, or perhaps "parasite" of co-operation. Or at least a part of us, for I believe there has never been any community yet where the disease has reached but a part of the inhabitants were immune from all forms of contagion.

Those of us who took "it" in the worst form, talked co-operation in season and out. This finally resulted last February in the formation of the Sebastopol Berry Growers Incorporated, under the laws of the state, with a charter which allows us to do anything we might care to do in the fruit and farm supply line. This happily took place just in time to prevent half of us having our wives leave us in disgust.

I wish to say that it is actually appalling, the amount of time and talk it takes to get this virus to work.

We incorporated with thirty out of one hundred and twenty-five growers; secured a manager in the person of a

ence as an asset for future business.

Some of the things we found we needed, and succeeded in getting; in part this year, and a promise of next were; lower rates, smaller minimum loads and better railroad times and connections.

While we are in the habit as fruit growers of laying most of our troubles to the railroad and express companies there is one thing we must not lose sight of; and it is this; unless our fruit is properly picked, packed and loaded, all the railroad rates and service in the world cannot make it arrive in good condition at the other end. This rests with your individual growers and corporation inspection.

While some growers think they will lose their individuality by joining an association, they really have a wonderful opportunityt to preserve it in this way.

There is no doubt but that co-operation is a remedy for many of our ills. This is an age of combination. But it must be carried on strict business principles and we have much to learn. We may perhaps have to wander in the wilderness until we grow a new lot of men that are willing to give and take and pull together for their own sakes as well as the community, for the prosperity of a community is in a direct ratio to the prosperity of the individual. In the meantime we will have to depend largely on a Moses for leadership. But it does look as though the children of Israel had a pretty good time even in the wilderness. They certainly did not have to make any bricks for the Egyptians.

## PLANTING OF EUCALYPTUS.

(Continued from Page 612.)

wood working establishments in San Bernardino and thus build up the city while turning vast tracts of valuable lands to profit to their owners. This is a thing worth thinking about. It should enlist the careful thought of the owners of these lands, or others who might want to speculate in that direction.

With large tracts of eucalyptus growing about this city, there could be built up a line of industries, varied in their character, which would follow in the train of the production of the hard wood timber, that could

### Harvesting and Marketing.

The first fruit growers convention which I had the privilege of attending was in San Francisco seven years ago. In one of the discussions there the Hon. John Markely made this remark, "We have been telling the people in these conventions for the past twenty years how to grow fruit, but from now on we must show them how to harvest and market it."

And these are the two most important factors in any kind of fruit growing, proper harvesting and then getting the price that will justify the cost and labor of production.

Fruit raising of all kinds had its up and downs here in California, where production has been easy compared to reaching our distant markets, and our berries have been no exception to the rule. In these years of development of under production, over production, over consumption and under consumption, the berry business has had as many stages of prosperity as the much quoted prune.

We have heard in our district over by the coast a great deal these past few years of raisin growers associa-

party who had done considerable berry shipping business; thus securing all the available experience in this line.

Our main effort the past season was to get as many of our berries into fresh consumption as possible and thus relieve the canneries. By the time the crop was ready we had increased our membership to eighty. We took up the matter of carload shipments with Wells Fargo & Co., who gave us all the assistance in their power with the result of our sending a representative to the large Rocky Mountain and northern cities, including, Ogden, Salt Lake City, Denver, Butte, Spokane, Seattle and Portland and of our dispatching one or more cars to each of these cities. In some of them we did well and in some we did not, but all the time we were learning, and after the season was over and the smoke of battle cleared away we found that Wells Fargo had gotten about $8000 for transporting our berries, and after all our expenses were paid, we had as much or a little more than the man on the out side and our experi-

## Business Notes

### LOYAL TO CALIFORNIA.

California should be proud of Jack London, who, unlike many other writers, is loyal to his native state. He has recently returned from a two-years' cruise in the "Snark," during which time he visited many almost unvisited islands in the South Seas. He has written a wonderfully vivid and interesting account of this cruise, which will appear during the coming year in The Pacific Monthly, published at Portland, Oregon. His first story appears in the December, 1909, issue. Each story is distinct in itself, yet each one treats of some incident of the cruise.

Cut this notice out and send it with $1.00 to The Pacific Monthly, and you will receive this magazine until September, 1910, and the December number, just issued, containing Jack London's first story, will be sent to you free. Address, The Pacific Monthly, Portland, Oregon.

From Mr. O. W. Lehmer of the Yosemite Valley Railroad, Merced, Calif.: We have received considerable literature in regard to the Yosemite Valley as a winter attraction. Since the opening of the railroad from Merced to El Portal, the hardships of the winter trip have disappeared and there is given the opportunity of one of the most picturesque and satisfactory winter trips that can be imagined. The cost is not expensive when one considers the grandeur of the outing. The fare for the round trip from Merced is $18.50, but for parties the excursion rates are less. The hotels charge $4.00 a day for accommodation as good as can be found in any large city. To anyone wanting a winter outing a letter to Mr. Lehmer will bring full information of one of the most pleasant trips that could possibly be imagined.

The Tulare county citrus fair held at Dinuba made good as to expenses and has $28 in excess.

## When Daddy Lights the Tree

We have our share of ups and downs,
  Our cares like other folk;
The pocketbook is sometimes full,
  We're sometimes nigh dead broke;
But once a year, at Christmas time,
  Our hearth is bright to see;
The baby's hand just touches heaven
  When Daddy lights the tree.

For weeks and weeks the little ones
  Have lotted on this hour;
And mother, she has planned for it
  Since summer's sun and shower,
With here a nickel, there a dime,
  Put by where none should see,
A loving hoard against the night
  When Daddy lights the tree.

The tiny tapers glow like stars;
  They 'mind us of the flame
That rifted once the steel-blue sky
  The morn the Christ-child came.
The blessed angels sang to earth,
  Above that fair country,
We think they sing above our hearth
  When Daddy lights the tree.

The weest child in mother's arms
  Laughs out and claps her hands;
The rest of us on tiptoe wait;
  The grown-up brother stands
Where he can reach the topmost branch,
  Our Santa Claus to be,
In that sweet hour of breathless joy
  When Daddy lights the tree.

Our grandpa says 'twas just as fine
  In days when he was young;
For every Christmas ages through
  The happy bells have rung.
And grandpa's head is growing gray,
  But yet a boy is he,
As merry as the rest of us
  When Daddy lights the tree.

'Tis love that makes the world go round;
  'Tis love that lightens toil;
'Tis love that lays up treasure which
  Nor moth nor rust can spoil;
And love is in our humble home,
  In largesse full and free;
We all are very close to heaven
  When Daddy lights the tree.

—Margaret E. Sangster.

# Grape Storage and Transportation Investigations

## of the Department of Agriculture

An Address Before the State Fruit Growers Convention by Prof. A. V. Stubenrauch

THE grape storage transportation investigations of the Bureau of Plant Industry of the U. S. Department of Agriculture, begun in California several years ago, form part of the Fruit Storage and Transportation Investigations of the Department carried on in different sections of the United States. These investigations include a complete study of the various problems connected with the handling of fruits in storage and transit—the two are practically the same, fruit in transit being simply held under storage conditions while being hauled across the continent. Naturally, there are many factors which have to be considered, but the investigations have narrowed down principally to a study of the relation of handling in picking, packing and preparation for market to the occurrences of decay and deterioration in storage and transit. This part of the problem is fundamental and it frequently happens that when once this is thoroughly understood, the other parts of the investigation are comparatively simple.

From all the Bureau work on this problem one fundamental principle has been deduced, a principle so important that frequently the only problem connected with the avoidance of troubles in storage or transit is an application of the principle to local practice.

It has been shown that the different kinds of molds which cause the most common forms of decay in fruits while in transit and in storage are unable to penetrate the sound, normal, skin of the fruit. These molds generally gain entrance through mechanical abrasions produced in the preparation of the fruit for market. It is not unusual to find ten per cent of apples showing cuts or abrasions in the skin. Small fruits are more commonly injured, while oranges frequently show from ten to fifty per cent of the fruit with the skin cut by the clippers in severing it from the trees or by rough handling of the fruit in the packing houses. It has been demonstrated that by careful handling in the picking and packing of oranges under commercial conditions the injuries can be overcome and the decap can be almost wholly eliminated.

During the past four years the storage investigations have been extended to the table grape industry of California. These investigations were started with two main objects in view: A study of the factors which affect the keeping quality of grapes in transit and storage and the possibility of extending the markets and season of California grapes, ultimately with the hope of replacing the two-million-dollar importations of fresh Spanish grapes with the California-grown product held in common or cold storage. At present practically the entire Tokay grape crop has to be marketed within sixty days. Within a few years the output of this variety will nearly double. The necessity of either extending the season of marketing or of developing new markets becomes of vital importance.

### Cold Storage Experiments.

Our first efforts were directed toward the storage prolems and the results obtained in this work had a direct bearing on the transportation problems which were to follow later. A careful study of the behavior of a number of important grape varieties was begun. Some of these were grown commercially, some were not, and were included in the experiments to determine their suitability for introduction to commercial vineyards. The list of varieties includes the following, most of which were obtained from the University Experiment Station near Tulare, through the courtesy of the California Station officials: Flame Tokay, Muscat, Malaga, Thompson Seedless, Ferrara, Emperor, Verdal, Black Prince, Cornichon, Huasco, Bowood, Pizzutella, Perruno, Chasselas de Fontainebleau, Zabalkanski and Almeria. Last year and the present season varieties from Lodi included the following: Flame Tokay, Emperor, Ferrara, Verdal and Cornichon. This season a number of new varieties grown on the Government Experimental vineyards at Fresno and Oakville were added to the list, but as this work is only begun these varieties need not be named here.

The preliminary work included a test of different methods of packing: In crates without filling, and in tight boxes with various filling materals in comparison with ground cork, such as is used with the Almeria grapes imported from Spain. The list of packing materials, besides the ground cork included: Paper, both shredded and as a wrapper, wheat, bran, corn meal, ground corn pith, shredded and cut tule and redwood sawdust. All of these substitutes except redwood sawdust have been found unsuitable and have been abandoned. Redwood sawdust has been further tested and all of the results so far show that it is superior to the cork. The grapes packed in this sawdust hold longer and in better condition, and in future we shall probably confine our investigations of grape fillers to this material. It seems particularly fortunate that so valuable a substitute is at hand. It would be impracticable to use cork in this state on a large scale both on account of its high price and comparative scarcity. It is evident that the importers of Spanish grapes are becoming aware of the superiority of redwood, as already inquiries are being made in the interest of foreign growers regarding the practicability of obtaining this sawdust in quantity.

It is impossible at this time to state the reason for the better holding qualities of the redwood sawdust. At first it was thought to be due to the greater fineness of the material, but a comparison of it with cork ground or shredded to the same degree of finesess as the sawdust, while it shows some difference in favor of the finer ground material, does not indicate that this is the only cause. So far, no attempt has been made to treat the sawdust in any way except to be sure that it was thoroughly dry. The material has been obtained from planing mills working on dried lumber, and consequently the dust has been rather fine. The use of this fine sawdust this season on a rather large scale shows that while the fine material holds the grapes in prime condition it has a distinct disadvantage in clinging tenaciously to the grape berries especially around the pedicels, and it is difficult to dislodge these fine particles without a strong air blast. It is therefore evident that before redwood sawdust can be used commercially it will have to be freed of the fine dust and splintery particles. Millmen assure us that this would be a comparatively simple and inexpensive process by using a fan, and it could be done at the mill without difficulty if the demand for the cleaned sawdust becomes great enough.

The flavor of the grapes packed in redwood has never been found to be tainted as long as the sawdust is pure. A slight mixture of pine or cedar, however, seems sufficient to flavor the grapes when held in storage for some length of time.

The storage investigations show that for long holding a filler will have to be used. All varieties with the exception of the Almeria, and possibly the Emperr,, do not hold in first-class condition longer than thirty to forty days packed in crates, or too short a time, usually, for the holiday trade which is the market offering the best demand for fancy grapes in good condition.

It has been shown in the investigations with other fruits that one of the most important factors in the successful handling of fruits either in storage or in transit is quick shipment or quick cooling after the fruit is harvested. The sooner the fruit can be cooled after it leaves the tree or vine the longer time it will continue in first-class condition. This is especially true where there are any appreciable mechanical injuries in handling. It has been shown with oranges, for example, that after a delay in shipping or cooling of two to four days, the decay in transit map be from two to five times greater than under immediate shipment or cooling, depending upon the amount of mechanical injury in the fruit. These factors of quick shipment and quick cooling of two to four days, the decay in transit may case of table grapes than they are with oranges, for the reason that the ordinary grape package offers ideal moisture conditions for the development of molds and if the proper heat conditions are present molds are almost sure to occur. When a filler is used quick cooling is just as important if not more important. The filler acts, to a certain extent, as an insulation and cooling will be relatively slow under the best conditions. The converse is also true, and consequently the fruit should be packed as cool as possible. A very appreciable effect can be gained in this respect by taking advantage of natural cooling overnight, and where picking is done in warm weather it is always best to allow the grapes to remain open over night and pack the next day while cool. We had a good illustration of the deleterious effects of warm packing and declay in cooling during the present season.

The question has been asked whether grape storage will ever become a commercial business. We believe it will, and plans are being considered by the Bureau to extend the investigations along commercial lines and some of the grape growers of the State also are planning to make a commercial test next season. In the carrying-out of these investigations, nothing has been done which cannot be done under commercial conditions. The problem connected with the proper condition of the sawdust and its preparation for use will be investigated. The one great governing factor will be the introduction of these grapes into the markets. Just how this can be done remains to be worked out.

Quite an appreciable local market has been developed for cold storage grapes in Southern Cali-

# Citrus and Sub-Tropical Fruits

## CITRUS CULTURE AND DISEASES.

BULLETIN number 203 of College of Agriculture Experiment Station, which is a report of the Plant Pathologist for three years, is most interesting and instructive. It is writen by Prof. R. E. Smith, superintendent of the Southern California station. It touches upon a wide range of pathological subjects. From a few paragraphs under Citrus Culture and Disease we quote:

One of the most important undertakings of this Division is the study of citrus culture, this work being prominent both at the Whittier Laboratory and at the Riverside Station. The whole subject of citrus culture demands more and more attention from scientific investigation as the industry grows older, and the station founded at Riverside especially to meet this demand has possibilities of a most useful development, while at the same time its responsibilities to the industry are great.

The commencement of this citrus work under the direction of the Division of Plant Pathology should by no means be looked upon as an indication of a narrow scope or limited field in the future of the work, or that it is expected that its many phases will be covered in a superficial manner by work from a single standpoint. It is rather the intention to make these Stations centers of research on problems relating to citrus culture, developing facilities and special departments as rapidly and efficiently as possible.

### Disease Investigations.

The study of diseases or failures of citrus trees in California is a most complicated problem. This is due to the fact that the chief troubles are not of parasitic origin, but are due to abnormal physiological conditions brought about by the artificial environment under which the trees are grown. The exact nature of these troubles is in most cases extremely difficult of determination, while a demonstration of a remedy or corrective for the same is even more difficult. The case is very different from those where fungous or similar diseases occur. In fact, it is not entirely a question of health and disease with the citrus crop, but rather one of commercial perfection and its opposite; in other words, the perfection of desirable commercial qualities is by no means the same as natural development or natural health. The fact is that the work of the plant pathologist in California with citrus fruits is not limited to the study of actual disease and the means of avoiding it. He is rather called upon to advance commercial perfection and learn how to overcome conditions which are undesirable from this standpoint, whether they be ones of actual disease or not. For this reason it is natural that problems of soil fertilization and other cultural considerations should be closely associated with the work of the pathologist, since they cannot be sharply segregated.

A thorough study of what may be called the actual diseases of citrus trees in this state is being carried on in Southern California, both in the field and laboratory. As a result of this work thus far it may be said in general in regard to citrus diseases that almost nothing has been found which may be ascribed to the effects of any parasite. If we except decay of the fruit and a very few minor cases, the above statement may be made an absolute one. It is a fact beyond question that the most serious troubles with citrus trees in California are the effects of unfavorable natural conditions and not those of fungi, bacteria or other parasites. Some of these effects are at present most obscure, and difficult or impossible to account for in any satisfactory manner. Yet the study of the various diseases and of the nature of the tree itself has been sufficient to show that the above statement is true.

The citrus disease investigation is being conducted in the field by various members of the staff, while a large amount of more technical work is being done at the Whittier Laboratory in the preparation and microscopic study of affected tissues.

The particular diseases or troubles under consideration at present may be named as follows: Gum disease of the lemon, scaly bark of the orange, Florida die-back (Exanthema) of the orange, puffing, splitting, brown spot and staining of the orange, and pitting of the lemon. These are all serious trouble affecting very materlally the production of groves and the financial returns from the fruit.

The so-called "brown spot" of the orange is a subject which received considerable attention during the past year. This is a peculiarly obscure problem, and no positive results have been obtained as to the nature of the trouble or methods for its control. The disease shows itself in the form of dark-brown sunken spots of considerable size on the surface of the orange. These spots are not visible while the fruit is on the tree or when freshly picked, but develop within two or three weeks after picking, thus appearing mostly after the fruit has reached the eastern markets. The spot affects the most fancy, smoothest fruit worst and occurs abundantly only in certain sections. We feel safe in saying that it is not caused by any insect, fungus, bacterium or other living parasite and is not the effect of fumigation, spraying, ordinary frost or any such thing. The spot itself is simply a portion of the rind which weakens prematurely and becomes dead, dry and dark colored. Some influence must act upon the fruit at some time previous to the beginning of the picking season which causes the rind to be injured or weakened in these spots. It seems most likely that this influence is connected with some climatic condition peculiar to the region in which the trouble occurs. A large amount of negative information was obtained during the past season which is not without value in simplifying and more clearly defining the problem. The work will be renewed next season in a further effort to discover the real nature of this spotting.

In addition to these more specific diseases, investigation is needed in many cases of failures or troubles with trees which are occurring abundantly. This work commonly involves soil studies and chemical investigations of various sorts, and herein is illustrated the close correlation of such investigations with plant pathology proper in citrus work.

## MEALY BUG.

The mealy bug will do more damage to the citrus groves than any pest yet discovered except the white fly. It has done $75,000 or $10,000 damage already in Santa Paula.

They do not kill the tree but throw off a honeydew that causes smut which makes the oranges unmarketable. The horny variety of mealy bug does no damage but there is a colony of the dangerous variety right here in Fullerton. They seem to do but little damage at first but after a few years they spread very rapidly. It takes a very much stronger gas to kill the mealy bug than it does to kill any kind of scale.

The lemon tree will stand much stronger gas than the orange and it would be easier to kill the mealy bug on them. We should quarantine against the mealy bug at once and then form an association and raise money and buy the infected trees and destroy them.

The purple scale is an example of how a pest will spread. A few years ago they were in only a few of the groves and now scarcely any of them are free from this pest.—C. E. McFadden at Fullerton Institute.

## THE TRUE NATURE OF BACTERIA.

As a usual thing, when bacteria or germs are mentioned, we are apt to think of them as something to be dreaded and something from which no good could ever possibly come. This mistaken idea has arisen largely from the fact that our attention has been repeatedly called to this phase of germ life and nothing has ever been said about the immense benefits which we derive from it. Magazine and newspaper advertisements have been responsible for many of the wrong impressions about micro-organisms, for they have published illustrations in connection with advertisements for water filters, patent medicines and the like, in which they have pictured bacteria as miniature sea serpents, possessing thousands of wriggling legs, lashing tails, grinning jaws, mouths full of teeth and protruding fangs. Granted that the average reader knows better than this, these pictures do have their influence. Once and for always let it be here stated, for the benefit of those who may have been misinformed as to the correct nature of bacteria, that they are not animals, but minute plants, so small that it would take twenty-five thousand of some of them, placed end to end, to make one inch. When viewed under a powerful microscope, we can see that germs possess, in general, three different forms, namely, cylindrical, like a capsule, spherical, like a ball, and spiral, like a corkscrew.

In addition to these three forms, which are known as vegetative forms, and which correspond to the leaves and stems of higher plants, some bacteria produce tiny elliptical or spherical bodies within their vegetative cells. These bodies are known as spores and serve the same purpose as the seeds of flowering plants, namely, to carry the germ through a critical period and to reproduce the species upon the return of favorable conditions.

Although plants, many of them can swim about in water and milk and the body fluids of animals as actively as if they were little fish, they are able to accomplish this by means of very delicate thread-like appendages attached to the sides or ends of their bodies. These swimming organs are known as flagella.

The growth and multiplication of bacteria are very simple and rather rapid processes. As soon as a germ reaches maturity, it divides in the middle and becomes two germs in much the same way as you would separate two halves of a capsule. Under favorable conditions this division takes place once in about every twenty minutes, so that if you have one newly formed germ at the present moment, you will have two similar to this one in twenty minutes from now, four in forty minutes, and eight after one hour. At this rate of increase, it does not take a bacteriologist to tell you that, if numbers count for anything, in twenty-four hours you may have enough bacteria on your hands to do you a great deal of good or a great deal of harm, depending upon the kind of germs you are growing.—Walter G. Sackett, Colorado Agricultural College.

## BISULPHIDE OF CARBON.

This liquid is used in destroying stored grain insects and the like, and also some pests under ground, but principally the former. The liquid evaporates very rapidly, the gas being deadly to animal life when confined in it for any length of time. In fumigating grain or other similar material use one to three pounds of the liquid to 100 bushels of grain. The gas is exceedingly explosive; therefore do not allow any light, cigar or pipe around the building when fumigating. It is sometimes injected into the soil around the roots of the plants to destroy certain pests. In such cases a tablespoonful of the liquid injected a short distance from the plant would be sufficient. The gas is heavier than air and consequently it will sink into a pile of grain or down into the earth.

Residents of the Perrin Colony are proposing large things in drainage to reclaim alkali land.

**This powerful I.H.C. Engine will reclaim your waste land**

IT is one of the great family of I.H.C. engines which is bringing unheard-of farm prosperity where all was a barren waste a few years ago.

Thousands of farmers are using these simple, powerful engines for irrigating their lands, and they have no other source of water supply. The engines pump water where it is needed. They pump water in quantities. They do it economically.

Have you a water problem to solve? Why not look into the matter and see what one of these engines will do for you?

**What I. H. C. Gasoline Engines Mean to Irrigators**

**First**—In hundreds of cases they avoid the necessity of going away up-stream and building long, expensive ditches.
**Second**—They do away with costly ditch maintenance.
**Third**—They make an independent water supply possible.
**Fourth**—They enable you to store in reservoirs on your own farm the water that would otherwise flow by in the low-lying stream and run to waste.

You know the trouble is not so much a scarcity of water as of getting the water to the right place. An I. H. C. Gasoline Engine enables you to take advantage of the low-lying lake or slough or spring on your place, or to pump water from the stream that flows by at the foot of the bluff.

The I. H. C. line includes an engine for every section and every problem—all sizes for all farm uses—vertical, horizontal—both stationary and portable; engines on skids; sawing, pumping and spraying outfits. Also I. H. C. gasoline tractors—first-prize-gold-medal winners—the best all-'round farm tractor by test.

An I. H. C. gasoline engine not only frees you from the worries of uncertain rainfalls and the irregularities of gravity irrigation, but the problem of the hired man is simplified—the efficiency of your other farm machines is more than doubled. It will operate your grinder, fanning mill, cream separator, churn, pump, thresher; your bean huller, cider press, alfalfa cutter, and any other machines requiring power.

# Deciduous Fruit Culture

## DEVELOPMENT IN FIG CULTURE.

(Continued from last Week.

### Cuttings and Caprifigs Available from the Loomis Orchard.

At the Maslin seedling fig orchard at Loomis, Placer county, which is under lease to the U. S. Department of Agriculture, are several very desirable capri, as well as a number of choice trees of the Smyrna type. These capri trees have now been sufficiently studied to enable us to select a half dozen or more of the very best. They are vigorous trees producing mamme and mammoni crops in sufficient abundance, and above all enormous profichi crops of large figs, abundantly infested with Blastophaga and having plenty of pollen. The resources of this orchard, both in caprifigs and cuttings, are placed at the disposal of all who are interested in fig culture. Cuttings from the best trees without cost and caprifigs at the bare cost of gathering and shipping will be supplied when requested. Anyone desiring either the fruit or the cuttings has only to send his name to the writers at 1813 Pierce street, San Francisco, and he will receive blank applications and circulars giving the conditions of the distribution. Last winter nearly ten thousand cuttings and seedling trees, and last spring several hundred boxes of mamme and profichi caprifigs were distributed. This winter and next spring further distributions of the most desirable kinds will be made.

### Planting Capri Trees.

Every grower should aim to have an independent supply of fertilizing material of his own. This can be done only by planting a number of varieties of the best capri trees proportionate to the number of Smyrna trees in his orchard. If he has old trees of any variety he deems undesirable for any cause, let him insert capri grafts of the best kinds and by this means supply himself much sooner than by waiting for young trees to come into bearing. Smyrna trees will show some fruit as early as two and three years and will, if caprified, come to perfection. It is recommended that capri trees at the rate of two to each acre of Smyrna trees be planted by themselves in one corner of the orchard, or if there is a knoll or spot reasonably free from frost, put them there. They may be planted as near as 20 feet apart and if shelted by a windbreak to keep off cold winter winds all the better. A number of growers may combine and plant a tract to capri trees in a sheltered spot even at a distance from their orchards, if thereby they can secure protection from the hardest frosts and also obtain earlier profichi caprifigs in readiness for the first Smyrna figs that reach a receptive condition. There is no danger of an over supply of caprifigs, for there will always be a demand for the surplus from growers who have from some cause an inadequate supply. In the fig districts of Asia Minor, where fig growing has been a great industry for thousands of years, caprifigs are a regular article of trade in the markets.

The reason for planting capri trees apart from the Smyrna trees is that they more effectually fertilize each other and that a more even distribution of the caprifigs may be made by and among the Smyrna trees. The question is often asked: Why not plant the capris among the Smyrna trees and let nature take her course? In Asia Minor it is firmly believed that over-pollination is the cause of the splitting of figs. The writers do not believe that this is the sole cause, if a cause at all, of the trouble, for reasons that will be given farther along. It is not desirable that more than one or two Blastophagas should enter each Smyrna fig. At Loomis where at times the insects are seen hovering over the trees like swarms of gnats, it is not unusual for a dozen to enter a single fig. One of the writers has counted as many as 25 wasps in one fig and another struggling mass of 15 at the entrance trying to get in. Capri trees planted at considerable distances from each other in the orchard receive very little help from other capri trees in carrying the insect from crop to crop, and when the tree is of a variety that carries no mamme crop, its profichi crop is likely to be a failure. It may be noted that the more accessible the figs to be caprified are to the Blastophaga, the more of them will be entered. In some instances we know that the wasp has fertilized trees some miles away, perhaps carried by the wind, but not in sufficient numbers to produce a crop.

### The Splitting of Figs.

The past season is reported everywhere to have been an ideal one until the September rains came. These were followed by cool damp weather with considerable splitting and souring of figs. It is the sentiment of many growers that splitting is caused by cool damp weather and not by over pollination, nor excessive irrigation. One of the writers has seen figs growing on the banks of an irrigating ditch, in which water was flowing a good part of the year, and the fruit on these trees split no more than on trees in other parts of the orchard which were irrigated only twice during the season. One grower, however, speaking of the large size of the figs on these trees said he would rather have some splits than small fruit. One large Smyrna fig orchard planted on ground so moist that a drainage canal is being constructed through it, showed very few figs. Certain trees and some varieties, the White Adriatic for instance, split worse than others. In the Maslin orchard are trees with fruit that split more or less every year, while others, equally surrounded by capri trees and swarms of Blastophaga, show no splitting at all. Location seems to have something to do with it, as in Fresno county in those orchards near the foothills the trouble seems to be less prevalent than out in the valley. The past season in most localities has been the worst in several years. Still it is not a very serious matter. It is noticeable that of the Lob Ingir many split specimens close up in drying and still make good figs. This fig contains so much sugar that, unlike the White Adriatic, very few sour even when split. It is at present difficult to account for this trouble in many cases and the subject should have further study.

### Curing Figs.

It is well known that when the Smyrna fig is perfectly ripe and nearly dry it falls to the ground. It is likely that most growers will find it less troublesome and about equally profitable to sell the product to the packing house as soon as sufficiently dried, rather than attempt to gather around him the necessary labor and appliances to put his fruit into elaborate packages in order to secure the highest price.

A few suggestions, some of which represent the experience of the growers who are putting up the best figs now on the market, may not be out of place at this time and may be of service to the inexperienced. One of the most important details, though troublesome, is to gather the fruit from the ground very often, in fact as often as every other day. This will in a great measure prevent the entrance of beetles that lay their eggs and make wormy figs. Another important consideration is not to dry the figs too much. If too dry the seller not only suffers by loss of weight, but also injures the quality, as over dried fruit must be processed before it can be packed. When the figs have become sufficiently cured they are still pliable, yielding to a slight pressure of the fingers. In very warm weather the smaller figs are sufficiently dried when they fall from

**HENRY SHAW, Santa Cruz, Cal.**

The Wenatchee Valley Fruit Growers' Association recently shipped 26 cars of apples in one shipment to London.

the tree. The larger will require exposure to the sun on drying trays for two or three days. After the figs are sufficiently dried they are rinsed in clean water to remove any dust or dirt that may have adhered to them and are then exposed to the sun long enough to remove the surplus moisture. After grading as to size they are put into sweat boxes and are pressed down into a solid mass where they remain a week or ten days to undergo a sweat. This treatment is a very important part of the curing process. The overdried fruit absorbs moisture from the under dried, softens the skin and is a decided benefit to the whole. In this condition the figs go to the packer.

In order to kill germs or the eggs of insects that may have been deposited in the figs while exposed under the trees or on the drying trays, some packers expose the fruit to hot steam for a few minutes, while others immerse it in boiling brine, made with three ounces of salt to a galion of water, for two or three minutes. In curing the figs exhibited salt was used. After this heating process the figs are soft and pliable and are then split open from stem to apex and spread out in layers and pressed into bricks of a pound or half pound in weight and are then either wrapped in waxed paper, like those before you and the bricks packed into 25 pound boxes, or are first put into fancy cartons and then packed into boxes of various sizes.

It may here be mentioned that certain varieties of trees produce figs that may be called self sealed, the eye being stopped by a drop of hardened syrup or pellucid gum that effectually prevents the entrance of filth, beetles and other vermin, and thus assures figs that will not get wormy without the scalding process. Cuttings of this variety will be available from the Department distribution mentioned above.

**Conclusion.**

While the production of the finest figs requires some attention to details, such as the care of the capri trees and caprification, not necessary in growing other fruits, there is nothing in the work not easily mastered by laborers of average intelligence; while the fig tree possesses compensating advantages. The crop is never lost by late spring frosts, the tree requires little pruning, no spraying and no thinning of fruit, which means a saving of labor fully equal to that required in caprification. The prospective fig grower need not, therefore, be deterred from entering upon the industry for fear of troublesome details, while he can be assured that when his trees are five or six years old and in suitable soil and climate, they will bring him a gross income of about a hundred dollars per acre at present prices, with a steady increase for a generation to come.

## APPLE CROP.

Many of the middle western and eastern states reported small yields this season, due to failures in numerous instances, but generally because of pests. Orchards have been neglected and in scores of places the trees have been permitted to die because of lack of even ordinary attention.

In 1896 the total product of the crop of the country was 69,070,000 barrels, or 177,675,000 bushels. Since then hundreds of thousands of acres have been added and yet the government reports show that the aggregate crop in all the states in the Union was no more than 25,000,000 barrels or 62,500,000 bushels in 1908.

There will always be markets for apples. There never can be an overproduction of first class stock. It is, in fact, impossible at the present time to produce the quantity of good apples requisite to meet the demand. This is evidenced by the fact that England, Germany, France, Denmark, Australia and the Orient are already drawing on the orchards in Washington, Idaho, Oregon and British Columbia.—Green's Fruit Grower.

Coachella Vailey is contemplating the planting of many early grape vines this season.

The New Book of the Germain Seed & Plant Company of

**Vegetable and Flower Seeds, Ornamental Plants, Shrubs, Etc.**

Should be in your hands before you buy for spring planting. It gives full information as to the habits and characteristics of all classes of Farm and Field seeds, Flower seeds and Ornamental plants, and shows many of the best kinds as grown in tropical Fields, Gardens, Lawns and Yards. It suggests many numerous pleasing ideas for planting gardens LARGE and SMALL.

**A hint of what this new book is like**

Herewith we reproduce in Miniature the cover and one of the illustrations of this book.

**The Matilija Poppy**

shown herewith is thus described by the book, is such a handsome plant the Nursery Department gives it first place. The flowers are pure white, with great sweetness, make fast friends everywhere; they are very hardy and thrive in almost any soil, making both ornamental and desirable specimens for Lawn or Garden.

**How You May Get a Copy Free**

This book has a very complete line of Vegetable, Farm, Field, and Flower seeds, a Nursery and Poultry Supply Department, has 100 pages and covers, is printed on a fine paper, has been carefully written from ripe experience of the Management of Germain Seed and Plant Co., and is illustrated from specially made photographs. It cost a great deal of money to produce this book, and each copy takes 3c postage. No promiscuous distribution to persons not interested in home ground decoration and gardening is practicable, but we will gladly send a copy Free of all Charges to anyone who owns a home, or expects to own one soon. The Edition is Limited, send your name in early.

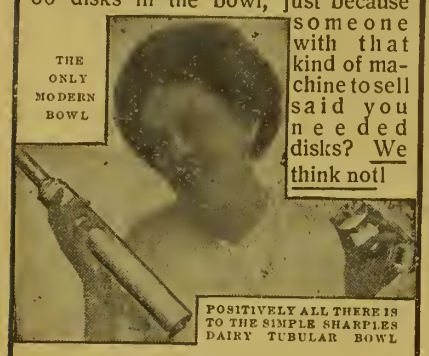
# Would You?

Would you buy 40 to 60 milk pails just because someone with pails to sell said you needed that many to milk a cow? Certainly not!

Would you buy or bother with an old style cream separator, with 40 to 60 disks in the bowl, just because someone with that kind of machine to sell said you needed disks? We think not!



Sharples Dairy Tubulars are The World's Best Cream Separators—and have no contraptions. Twice the skimming force. Fastest, cleanest skimming. Easiest running. Most durable. Sales exceed most, if not all, others combined. Probably replace more common separators every year than any one maker of such machines sells. World's biggest separator factory. Branch factories in Canada and Germany. These facts prove contraptions are not needed.

## ALFALFA.

THE old Fancher Creek ran across the lower portion of the home ranch, before it was made to run sedately between banks by the irrigation company. It used to run wild at high water over the land. The sediment carried was deposited in streaks of soil and clear granite sand. When these sand strips are planted to crops they are barren. The seed planted there is like the seed in the Bible parable, it springs up quickly and soon dies away from want of roots. These places will grow rye in the winter time and if this rye is turned under while green, it will add humus to the soil and often in a couple of seasons redeem the bare spots completely. Unless humus is added to the soil it is little use to try to make alfalfa take root. The nitrifying bacteria are necessary to a good yield of alfalfa and unless the humus is present these organisms have not the proper conditions for their multiplication.

### Inoculating.

A new planting of alfalfa should be inoculated to secure prompt returns. A simple way is to take up a few alfalfa plants in the old field and examine the roots for nodules. If plentiful take the soil from around the roots down to a foot or two from the surface. Haul in some fresh earth and put back the alfalfa plants that have been removed, for it will make a scar on the surface of the field to leave them out. The soil removed from around the alfalfa roots is put on the land with the new seed. Some times it is broadcast over the land from a wagon bed and then turned under at once. This may be successful if the day is dull and the covering done at once. Sometimes the seed and soil are mixed in the sower and thrown on the land and covered at once. The safe way however is to put in two-thirds of a barrel of soil and one-third of a barrel of seed and moisten the mass over night. The soil is taken in sacks, two sacks of earth to one of seed. They are mixed as the mass is put into the barrel and lightly sprinkled during the filling. The barrel is covered closely and taken out to the field. There it is rushed in the ground as quickly as possible and covered at once. Alfalfa manure is also a good way to inoculate land. This can be used to plow in early in the season and will secure abundant inoculation with active bacteria.

### Seed.

One farmer in this neighborhood has been figuring the actual amount of alfalfa plants that grow on an acre. Taking ten pounds of seed as a basis of sowing, he first weighed out one pound of seed and then figured out the number of feet in a tenth of an acre of land; then took the tenth of the land and a tenth of one pound of seed. This small amount of alfalfa seed was counted carefully by hand, only the good plump seeds being used. The surprising part of this was that he found that if 80 per cent grew that five pounds to the acre would give a stand of plants only a little over two inches apart. The reason why it is necessary to use twenty pounds of seed on an acre of land is slovenly preparation of the soil. The seed falls on poor land, poor in the sense of ill prepared, or the seed is not covered with earth and dries out or else it is buried too deep to reach the light. With alfalfa seed at eighteen cents a pound it is well to look into this matter closely. As a preparation, as well as a good moral lesson, if the man planting seed would turn to his Bible and read the parable of the sower and then think it over, the next year's sowing would be improved. The Bible also says, "My people do not consider."

### Growing Seed.

The best alfalfa seed comes from nearby places and is better than that imported into the state. The man whose water supply is not over abundant can make more by growing alfalfa seed than by growing hay. The first two cuttings are made into hay and then as the water from the winter rainfall has been pretty well used up, the plant makes the best seed. The third cutting is let mature slowly and then cut and thrashed. The straw left makes good horse feed and the seed is very profitable. Sometime a fourth crop comes on and is also cut for seed. The third crop is used because it is clean from weed seed, and also because it comes when it can be cured without danger of moulding.

The seed of alfalfa varies in color from olive green to yellow green in color and is two-thirds or more longer than it is wide. It always shows a distinct scar at the edge of the middle of greatest length. This is the mark or moon where it was joined to the pod. The actual form of the seed is a distinct crescent, a crescent that is blunted and slightly thickened in the center, or a crescent on one-half the other running to a square corner. The harmful seeds that come mixed with alfalfa seed are fortunately not numerous, the worst is the dodder that is quite distinct when it is closely examined. Dodder seed is round, yellowish brown seed and has a scar directly in the center where it was held in the seed cavity. The narrow slender alfalfa seed can be shaken end wise through a wire screen while dodder seed remains on the sieve. It pays well on account of dodder to screen all alfalfa seed.

### Dodder.

This plant proved abundant last season. Nearly all the new plantings were badly infested. The people at large do not as yet seem to have any very clear idea of the necessity of getting rid of it. I constantly meet renters that do nothing for it and say it does not matter as they sell the hay. So the dodder is seeding itself more and more on the alfalfa fields. It is distinctly a narrow view to think that it is right to sell a neighbor a pest that will in time decrease the value of his land. We can do nothing alone in this world and when I injure my neighbor I lessen the value of my own property. A poverty stricken neighborhood is one to shun and will not build up. Dodder not restrained will quickly make the land worthless for alfalfa growing. This plant is a wicked thing for it starts in life with a root like any other useful thing, but soon sends out a sucker into the neighboring plant of alfalfa and lives, blooms and forms seed on the juices extracted from the host. When a single spot of dodder appears destroy it at once, right where it is. Any attempts to move the mass to a more convenient place will scatter the seeds around. It never seems to hurt the alfalfa roots to burn the dodder off. A few sacks of dry strawy waste and a can of crude oil are hauled out on a truck. The dodder spots are covered with the straw and a little oil is sprinkled over the top and then the whole mass is set on fire. This daily work of destroying the spots with fire should be carried out until no more spots of dodder can be seen. Do not leave it until next week, but do it at once.

### Yellow Butterflies.

The hosts of little bright yellow butterflies toying and flying over the green alfalfa fields and the smaller brown ones dancing around with them are charming to see, but do not ac-

cumulate too many of them for their beauty's sake. The cunning little green worms that make the butterflies eat the alfalfa. When they are numerous the field should be pastured off as the tramping of cattle seems to be the cheapest way of disposing of them.

**Clipping.**

When the new alfalfa plants are about six inches high, they can be greatly strengthened by running the mower over the tops. The clipped tops are dropped down on the ground and act as a mulch around the young plants. The clipping strengthens the plant and causes it to stool out more broadly. Disking of the alfalfa comes when the field is two years old. This again tends to thicken the stand by splitting the crowns into two, three or four pieces. The disks should be set up as straight as possible to secure the down-cutting without any off-slicing of the crowns. When the foxtail is three or four inches high the seed will have all sprouted and no new seed formed. Then is the time to disk it down, choosing, of course, a time when the ground is not too wet, but when it will turn up friable and loose. New seed may be sown at this time and come up readily, or else it may be thought best to give the land a stiff seeding to barley. When this is done, where the stand is considered heavy enough, the result is that a good crop of mixed hay is secured and foxtail held down. The alfalfa comes out clean at the second cutting and while I have never tried this plan, I have no reason to think those who are securing good crops and clearing off the foxtail are not doing well. I use the first crop in the silo so that it does not matter much if there is a mixture of foxtail in it. Foxtail is a rich grass and the butter has a fine flavor when made from it.

**Johnson Grass.**

When an alfalfa field is used for hay the constant cutting after a few years disposes of the Johnson grass. When Johnson Grass is not allowed to go to seed it does not make deep heavy roots. Now the only way it can possibly increase in the mowed field is by allowing a crop to mature seed after the last cutting of alfalfa hay. Watching this point makes it possible to control the Johnson grass perfectly. It has become a common practice to sow infested land to alfalfa to clean it up, before planting the land into vineyards and orchards.—M. E. Sherman.

## BRITAIN IMPORTS LESS BEEF.

Figures issued by the Department of Agriculture respecting American beef exports show whither we are drifting in the trade with our heretofore good customers in the foreign countries, and particularly the United Kingdom. Latest statistics regarding the imports into the United Kingdom during the past year as compared with 1907 show a big decrease in our trade. In 1908 there were imported into the United Kingdom live stock for food to the value of $31,872,168, a decrease of $7,570,800 compared with the previous twelve months, while a total of $50,165,828 of fresh beef was imported, a decrease of $432,145, and this total decrease in the import trade in fresh beef indicates that a considerably increased volume of cheaper beef was received as against the year previous, and it came from other countries than the United States.

American exports of dressed beef into the United Kingdom during 1908 in value were approximately $15,906,641, a decrease of $9,256,000 from the year before, while in our exports of live meat animals a total volume of business of $21,704,590 was noted, indicating a decrease of $7,610,232 from the year before. Thus has the United Kingdom in the year just passed favored the other countries as against the United States in buying the beef and other meats for food. A great portion of the decrease in American live cattle and dressed beef exports was due to the increased trade which the Argentine Republic enjoyed with England and also the favor with which the Canadian beef found sale.

The "Crop Reporter" of the Agricultural department gives interesting statistics relative to the export beef and cattle trade for 1908, as against 1907. Our total exports of fresh beef are shown to have been 156,133,985 pounds for 1908, against 269,411,737 pounds, while the canned beef exports were 17,455,000 pounds, against 22,145,993 pounds in 1907. Our exports of domestic beef and products for 1908 were 579,303,000 pounds, against 687,752,000 pounds in 1906, in which year American exports were the largest on record.—Farmers' and Drovers Journal.

## IMPORTATION OF MILCH GOATS.

In its issue of November 18th the Cultivator had a communication from Mr. Lobingier on the subject of milch goats, in which he referred to the fact that "It is now impossible to import milch goats from continental Europe." This is true, but the tone of the article might carry the idea that there is no importation of goats from any section to this country, so we quote from a letter written to us by R. W. Hickman in charge of the quarantine division of the bureau of animal industry. Mr. Hickman says: "I beg to advise that you are in error in your impression that there is a strict quarantine against the importation of milch goats into the United States. On the contrary goats may be imported into the United States under similar conditions to those which govern the importation of cattle, sheep, and other ruminants, and swine. They may be imported from Great Britain, Ireland and the Channel Islands. The importation of goats or other ruminants from the orient, or from the counties of continental Europe, is not permitted, on account of the contagious and infectious diseases of live stock which exist in those countries."

Regulation 11 of Order 142 of the Bureau of Animal Industry gives information as to manner of importation as follows: "Any person contemplating the importation of cattle, sheep and other ruminants, and swine from any part of the world except North America, must first obtain from the Secretary of Agriculture two permits, one stating the number and kind of animals to be imported, the port, and the probable date of shipment, which will on presentation to the American consul at the said port of shipment entitle them to clearance; the other stating the port at which said animals are to be landed and quarantined and the approximate date of their arrival, and this will assure the reception of the number and kind of animals specified therein at the port and quarantine station on the date prescribed for their arrival or at any time during three weeks immediately following, after which the permit will be void. These permits shall in no case be available at any port other than the one mentioned therein. Permits must be in the name of the owner of or agent for any one lot of animals. Permits will be issued to quarantine at such port as the importer may elect, so far as facilities exist at such port, but in no case will permits for importation at any port be granted in excess of the accommodations of such port."

From this it will be seen that milch goats may be imported under the same regulations as cattle, which is, in fact, according to the letter of Mr. Lobingier's statement, but it is plain that one may purchase goats in Great Britain, Ireland or the Channel Islands, if he so desires, and bring them into this country.

P. D. Fowler and A. G. Schulz, both passed in the examination for horticultural commissioner of Tulare county. Mr. Schulz has received the appointment from the board of supervisors.

Farmers at Klamath Falls, Oregon, are planting ginseng.

**AMERICAN FENCE**

*Made of Hard, Stiff Wire, of Honest Quality*

**Fences Cost the Least and give the most returns of any improvements on the farm**

Look around and see the farmer who has money in the bank and who buys another quarter-section every few years. See *his* farm—it is fenced hog-tight. What is good for him is good for you. Enough feed is wasted on the average quarter-section of unfenced fields to feed a large drove of hogs.

Any American Fence dealer will quote you figures that may astonish you on fencing your farm with heavy, hog-tight fence. You have no idea how little money it takes, considering what you will actually save.

American Fence is made of hard, stiff steel. It is made of a quality of wire drawn expressly for woven-wire-fence purposes by the largest manufacturers of wire in the world. Galvanized by the latest improved process—the best that the skill and experience of years has taught. Built on the elastic, hinged-joint (patented) principle, which effectively protects the stay or upright wires from breaking under hard usage.

The real test of a fence is the service you get out of it. Test, judge and compare American Fence under any and all conditions and you will find that the steel, the structure and the galvanizing are equal in durability, strength and efficiency to the hardest usage.

## HOW DOES YOUR GARDEN GROW?

THE chances are that you will answer this question by saying your garden grows as well as your neighbor's.

The chances are equally good that neither you nor your neighbors make your gardens grow as well as they might, says a writer in The Farm World.

The truth is that the average farm garden is only given about one-fourth as much fertilizer as the crops would put to good use.

This may seem like strong talk, but it is true. The city market gardener uses fertilizer in a way that would make a farmer anticipate bankruptcy in the immediate future, yet city market gardeners are not the kind of people who waste money.

The quantity of fertilizer which would be enough and to spare on an average farm crop is just a good beginning for a truck patch.

Gardeners often put 100 tons of stable manure on an acre of land in New Jersey and around Chicago and the gardener puts no more than he thinks can be used to advantage.

This feed of fertilizers is repeated year after year, too, on these city gardens, and often commercial fertilizers are used during the growing season, besides the stable manure.

Peter Henderson once said that his rule in using stable manure was to put on enough and then some more, and garden crops will flourish under such feeding too.

Plant a tomato vine on top of a pile of rotted stable manure and watch it grow, if you do not believe this.

For many generations our garden crops have been grown on soil which has been largely made up of manure and other fertilizers and they have acquired appetities such as ordinary farm crops never have.

They are every one gross feeders and the more we feed them the more tender and the larger the plants grow.

It is now too late to talk about plowing into the soil but it is not too late to use well rotted manure or commercial fertilizers on the garden crops.

If manure which has been rotted by composting or lying in the barnyard is scattered over the surface of the garden between the plants and hoed in as the crops are cultivated, it will become immediately available, as the rootlets of the plants will begin to feed on it as soon as it becomes damp and they will make wonderful progress in growth if they have plenty of this kind of feed.

Have a bag of complete commercial fertilizer where you can get at it handily and keep scattering a little of it among the garden plants all summer.

A tablespoonful worked around a hill of strawberries or around a raspberry, currant or gooseberry bush will cause the plants to grow amazingly and bring them to perfection so they will be ready to produce heavy crops next year.

Onions, radishes, beets and all the vine-producing crops respond at once to these little feeds of fertilizer. There is not much danger of getting too much of the elements into the soil if it is put on a little at a time.

It is impossible to use too much stable manure which has been rotted, but one can get too much of some of the commercial fertilizers around a plant at one time.

The best way to use any fertilizer is to scatter it on the surface and immediately work it into the soil.

The rains will wash the fertilizing elements down into the soil where the roots can get at them.

If you do not believe in mid-season fertilizing just try fertilizing a few rows, leaving the remainder as check rows, in order to note the difference. If the season is not a very dry one you will find that feeding fertilizers to the garden is very profitable.

Keep some kind of a crop growing in the garden the entire year. If nothing else is done sow wheat, rye or a vetch on the vacant places to keep weeds from springing up and maturing seed. Weeds ripen in a very short time, if they are allowed.

**Eucalyptus Seeds**

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." ## Ornamental

### BEAUTIFYING HOME GROUNDS.

PROPERLY planting the right kind of trees, shrubs and plants on the home grounds means much more than mere beauty—it has a decidedly practical side. It is cheaper to beautify the home grounds than to allow them to go bare and uninviting.

Decorating the home grounds transforms a house into a home. It makes the house a part of a beautiful picture, and surrounds it with such evidence of loving care that it immediately impresses the beholder with the feeling that people live in the house—that they do not merely exist there.

This "homey" feeling the proper planting of trees, shrubs and plants imparts to the house is worth far more than the cost of the material used in its embellishment or the labor involved in taking care of it. It preaches the gospel of beauty not only to the home folks, but to the neighbors and passersby as well, and its influence spreads afar.

Many a man passing a farm home made lovely by trees and shrubbery has been lifted up above the sordid conditions which surround him and has immediately commenced to transform his own grounds in keeping with those of his neighbor. And so the gospel spreads.

The inside of the house soon reflects the charm of its exterior. When good taste and proper ideas of planting are displayed outside, it does not take long for the same ideas of artistic effects to control those who have the interior beautifying of the home at heart.

Children grow into better men and women when raised in a home surrounded by the beauties of nature. A feeling of pride causes every one of the household to take an interest in keeping the grounds in good condition.

A poor farm with good buildings on it will often sell for as much as or more than a good farm containing poor buildings. In just the same way a farm with its home grounds planted in the way we have suggested will bring a much higher price than one about which there is an air of neglect and indifference to beautiful surroundings.

Fruit trees and bushes may be used for two purposes—for the fruit they bear and for the ornamental touch they give to the landscape. A well selected and properly grown fruit tree is often as decorative in its effect as the highest-priced ornamental shade tree, and many berry-bearing bushes are almost as handsome as some of the fanciest shrubs. The shade and beauty afforded by a grapevine is too well known to need mention.—Journal of Agriculture.

### THE PIPE CALABASH.

Pipes made from the South Africa calabash, or gourd, have created considerable interest in the growth of the vine. It is a native of South Africa. The use of the calabash as a pipe bowl was discovered by the Boers and after the Boer war they were introduced in England and from there were brought to this country.. The Boers attempted to monopolize the product and to prevent the exportation of seed, but failed, and there is now a supply of the seed in this country. The vine grows luxuriantly and produces a large crop of gourds, but many of them have to be rejected for pipe making, either on account of defective growth or of insect bites which mar the surface. The pipes are graceful and distinctive in shape, no two being exactly alike. They color like meerschaum, and are delightful smokers. The imported pipes sell for from $8 to $12 each. One of the reasons for their high price is the necessity for hand work in their manufacture, as, on account of their varying shapes and sizes, machine work is not practicable. The growing, drying, and shaping of these gourds should be interesting, and they can be easily made into pipes by buying inside bowls and mouthpieces.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets; 654, 655.

## Cotton Again.

IN A RECENT Cultivator we referred to the extensive planting of cotton over the Imperial Valley and suggested care that no mistake be made in unduly boosting so that the uninformed should be led into planting without knowing the requirements of the crop. Touching upon the points brought out in the editorial J. W. Jeffrey says in his department in the Los Angeles Times: "The good old conservative and reliable Cultivator expresses editorial fear that the people of Imperial are liable to carry cotton to excess because of the success with this commodity last season. The warning is well-timed. Where nature has been most prodigal with her favors there agricultural achievement is most liable to run riot; there profusion is more liable to prevail than stint. * * *

"The American farmer has been set down as conservative. He is in leaving off old methods and trying new ones clear through to the consumer of his products. But he is prone to follow the multitude in what he plants for a living. That is what makes the multitude itself, and it makes mortgages and other modern contrivances of destruction.

"Why go into a delirium of expectation that may end in the stupefaction of experience? Andrew Carnegie said to "put all your eggs in one basket and then watch the basket." But Andrew was given the power to take every one by the collar who came his way and compel a deal in eggs on the terms imposed by the owner of the basket. Until the Imperial farmers reach the happy Carnegie state, they should continue to grow alfalfa, fruit, melons, hogs, cattle, cotton and Egyptian corn and everything else that will diversify the natural resources of that magnificent empire, for in that policy will repose conservative progress, safety and the final stability of land values."

But our good friend the Calexico Chronicle feels that we have a wrong impression of the vastness of the great Imperial. It says:

"The California Cultivator seems to have the impression that the entire Imperial Valley is about to be plowed up, the cattle sold and even the square yard that Heck, the pup, occupies with a kennel, is to be planted to cotton. It is possible to plant 200,000 acres that have never yet seen the edge of the disc; that the irrigated portion of Imperial Valley today is four times larger than the irrigated portion of Riverside county; that 25,000 acres of cotton would be only a small portion of the acreage, and finally, that farmers have no intention whatever of discarding everything else and going into cotton."

All of which is true and we glory in it. And still we say, let all keep their heads level.

## Knockers.

WE NOTE that some papers of the state take exception to the attitude of the recent State Fruit Growers' Convention in favor of discouraging production until markets are found for the fruits which have been over-produced, or at least produced in such quantities that they have not proved profitable to growers for the past year or two. The papers which complain about this "knocking" of California, maintain that it injures the state because California is built up by encouraging people to come here and take up the production of our wonderful fruits. But no matter how much we may wish these people to come and develop the state, it is worse than folly to shout prosperity where there is no prosperity. Producers of some lines of fruits have taken up marketing and advertising and won great profits. Let the growers of peaches, grapes and other lines which now appear to be overproduced take up similar efforts, and when the same profitable result is attained, then let them encourage others to take up similar lines of planting.

We do not believe a single attendant at the convention wished to bear the price of fruit land or discourage others from buying such land, but blinding our eyes to the true situation will in no way advance the industry. Therefore, let every thinker squarely face the problem, and let us all endeavor to solve it, to the end that our products may be handled so as to bring profit to the producer. When that is accomplished, all the knocking that can be done will not bear the price of fruit lands. Money talks louder than any knocker possibly can.

## A Decade.

MR. EDGAR F. HOWE, Editor of the Imperial Daily Standard, and a pioneer in the Imperial Valley, announces that he is about to issue a history of the first decade of the great Imperial Valley. Mr. Howe has been a resident of this valley most of the time since the stakes were first set there, in fact traversed it many times before a drop of water was ever carried to it. It is fitting that such a great empire should have such a worthy historian. Imperial Valley has been the wonder of the world in the development line, and the placing in permanent form of the history of its first ten years will preserve information of great value in later years.

## League of Fruit Growers.

At the recent State Fruit Growers Convention resolutions were passed calling for the appointment of a committee for the purpose of forming a league of fruit growers, the committee to consist of ten growers chosen from the independent shippers, the fruit distributors and the growers. The appointment of the committee was left in the hands of State Horticultural Commissioner Jeffrey, and he announces the following committee: J. P. Dargitz, Acampo; George H. Cutter, Sacramento; R. D. Stephens, Mayhews; George D. Keilogg, Newcastle; C. H. Rodgers, Watsonville; F. B. McKevitt, Vacaville; B. F. Walton, Sutter county; H. A. Fairbank, Lodi; Howard Kerchival, Lower River district; H. V. Pickstone, Santa Clara county. The committee will meet at an early date after the first of the year, and it is presumed a convention of fruit growers will be called within the next sixty days.

## Hall of Fame.

THE CULTIVATOR received an invitation to attend the ceremonies at the installation on December 15th of the name of Cyrus McCormick in the Memorial Hall of the College of Agriculture of the University of Illinois at Urbana. The invitation comes from the Commission of Illinois Farmers' Hall of Fame. We think this a worthy movement on the part of the farmers of Illinois to honor those who have advanced agriculture. It is a result of a desire to record the services and commemorate the lives of the great leaders of the state in the development of agriculture from a pioneer art to a civilized science.

The hall is situated in the College of Agriculture grounds at the State University, and each subject chosen will be represented by a painting and tablet reciting in brief his contribution to the evolution of agriculture. Other names chosen to honor the Hall of Fame are: James N. Brown, first president of the State Board of Agriculture of Illinois; Isaac Funk, pioneer farmer, and Prof. J. B. Turner, originator of the idea of the national system of land grant colleges.

## Be Fitted for Your Calling.

MR. J. B. NEFF in addressing the Farmers' Week audience at Davis the last of October, made the remark that one great defect of the farmer was his lack of education or of information as to his own calling. The lawyer, the doctor or the business man would never think of taking up his profession without long and complete preparation. Years are spent in schools and colleges before he begins the practice of his life work, but the farmer presuming upon the wealth producing power of his farm takes up his business after attending a school which has not aimed to fit him for farming, any more than for the practice of law, and with no preparation other than a stock of simple good sense. No other calling on the face of the earth could make enough money for those engaging in it to keep them from becoming bankrupt.

Even the institutes, farmers' weeks and other educational opportunities are given slight attention by the rank and file of farmers. The Farmers' Week at Davis called out extremely small audiences. Farmers' institutes are often better attended, but seldom crowded unless local committees organize to bring the people out.

Mr. Neff's idea was that the farmer's education should begin with the youth. He should be taught thorough respect for his calling and should fully master the science of the particular line which he expects to take up. Then he should so conduct his work as to do away with the long hours that have made the farm a place of drudgery.

The agricultural schools are coming. Support them and demand more of them till our needs be met.

## A Resourceful Worker.

The man on the farm more than any other of our citizens today is called upon continually to exercise the qualities which we like to think of as typical of the United States throughout its history—the qualities of rugged independence, masterful resolution and individual energy and resourcefulness. He works hard (for which no man is to be pitied), and often he lives hard (which may not be pleasant), but his life is passed in healthful surroundings, surroundings which tend to develop a fine type of citizenship.

In the country, moreover, the conditions are fortunately such as to allow a closer touch between man and man than too often we find to be the case in the city. Men feel more vividly the underlying sense of brotherhood, of community of interest.—Theodore Roosevelt.

# Agricultural News Notes of the Pacific Coast

## Northern California

Modoc county hogs have proved profitable during the past season.

Plows are busy in nearly all the grain fields of the Sacramento Valley.

A big alfalfa meal mill to be located at Meridian, Sutter county, is under contemplation.

Officers of the United States army are buying horses in Sutter county for cavalry purposes.

Many dredgers are busy in the neighborhood of Sacramento reclaiming thousands of acres of rich land.

The board of supervisors of Sonoma county has appropriated $250 for advertising the resources of that county.

Olive picking and crushing has begun in Butte county. One company alone has 400 men picking in the orchards.

Two petitions for the formation of reclamation districts have been filed with the Sutter county board of supervisors.

The board of supervisors of Colusa county has petitioned Congress for $400,000 for improvement of California rivers.

The Hayward Review reports striking of strong vein of water which will greatly improve agricultural conditions in the Castro Valley.

Modoc county irrigators propose to take up the matter of protecting the rights of owners of land in that county to the waters of Clear Lake.

Glenn county's school fund will receive $446.94, the county's share of receipts from grazing permits in California National Forest for the year 1908.

A correspondent of the Sacramento Bee asserts that federal laws if properly enforced will entirely prohibit damage to navigable waters from dredge mining.

The Petaluma Poultry Show last week had a large list of entries from all over the state. Entries from Sonoma and adjacent counties were reported especially fine.

The Poultry Show closed at Petaluma last week. Almost every class was well filled with good exhibits. Birds were sent from nearly every part of Northern and Central California.

Hundreds of acres of bottom lands along the Mokelumne River in San Joaquin county have been flooded. These lands were largely planted to potatoes and the crop has been seriously damaged.

Two wool sales were reported recently at Red Bluff, Tehama county, at which about 100 bales were sold at about thirteen cents. There are at this time stored in Red Bluff over 30,000 bales of wool.

Director Newell of the Reclamation Service has written the Oroville Register regarding rumors as to high prices paid for certain canals and water rights in Oregon, and says that the prices paid were approved by the property owners before they were accepted by the governmnt.

## Central California

Watsonville has shipped 3166 cars of apples to date.

Over 7000 tons are now signed up in the raisin pool.

Visalia is talking up its advantages as a walnut producing section.

Nurserymen over the valley are planning for a big planting season.

The farmers institute at Tulare last week was given a splendid attendance.

Last week's storm held up the orange packing in nearly all packing houses.

Tulare county citrus growers are greatly pleased over the returns for oranges this season.

Glanders contracted from a diseased horse has been the cause of the death of one farmer near Porterville.

The question of organizing a new agricultural fair association is being discussed at Hanford, Kings county.

Corcoran held an interesting institute last week, one of the features of which was the cattle judging contest.

High water washed away a bridge in Tulare county and did considerable damage during the storm of last week.

The fruit exchange packing house at Sanger, Fresno county, packed grapes and shipped them up to last week.

A raisin grower at Parlier, Fresno county, reports the record crop of thirteen tons from three acres of vines.

The early and liberal rains have given promise of the biggest grain crop over the San Joaquin Valley in many years.

A subdivision of a large tract of land under the Turlock irrigation ditch will place about two thousand acres in small farms.

No bids have been received thus far for raisins which are thrown in one pool by an agreement of many growers of Fresno county.

Green fruit shippers at Fresno are petitioning Secretary Wilson to send to that section experts who will determine cause of fruit decay.

The horticultural commission of Fresno county reports that the peach growers are not spraying as much as they should to prevent blight.

The Bakersfield Echo says that many orange growers in that vicinity are netting $500 per acre on their holiday fruit shipped this year.

One large ranch known as the Tagus Ranch near Visalia, which produced many tons of beets last year will be given over this year to the production of barley and wheat.

The record price for a car of Emperors sold in Chicago was won by a car shipped by the Fresno Fruit Growers Company from the Wahtoke district. The car commanded $2200.

Mr. A. G. Schulz, the new quarantine officer of Tulare county, has secured from the state horticultural commission the establishment of a quarantine which it is hoped will aid the fruit growers of that county in keeping out pests.

## Southern California

Riverside orange growers held one of the most instructive citrus institutes last week.

Lemons are moving forward as rapidly as cut from the trees. Prices have been very satisfactory.

Colton bee keepers are planning for a big meeting at their bee keepers institute December 28 to 29.

A quarter of a million dollars has already been divided among the members of the first lima bean pools.

The lemon exchange at Cucamonga has just occupied its new packing house, one of the finest in the country.

A large number attended the farmers institute held at Coachella last week and a most interesting program was provided.

Oranges from Yuma, Arizona, are being sent to Los Angeles for decorating the Southern Pacific offices for the holiday season.

The weather bureau has determined to establish two sub-stations in the Imperial Valley to gather information as to temperature.

The Anaheim fruit growers exchange reports that not a single member has withdrawn from the organization during the past year.

The bean growers association is becoming stronger every day, one grower recently signing up with over 12,000 sacks to add to the pool.

Southern California fruit shipping points have developed a new line this year in shipping dried and canned fruits to various European ports.

In some sections of Southern California, the gathering of holly in the past has been so strenuous that the supply has been greatly decreased.

E. F. Howe, editor of the Imperial Daily Standard, is contemplating the publishing of the complete history of the Conquest of the Colorado Desert.

The president of the California state organization of the farmers' union delivered an address at the fair held at El Centro, Imperial county.

Ranches at Ioamosa, San Bernardino county, are constructing a storm water drain to care for storm water which has done much damage in the past.

Redlands packing houses have their picking gangs gathering the earlier fruit. The gang picking plan is becoming compulsory with many of the shippers.

The county farmers union met last Saturday at Indio. Other meetings in the interest of the organization were held at Mecca, Thermal and Coachella last week.

The Stewart Fruit Company is planning to erect a packing house at San Fernando, equipped with all modern facilities for handling both citrus and deciduous fruits.

The State Polytechnic School at San Luis Obispo offers a series of short courses extending from January 5, to 29. General dairying, dairy manufacturing, and poultry husbandry will be considered.

## The Coast

Lewiston, Idaho, oat producers are securing $1.35 per bushel.

The Twin Falls, Idaho, Poultry Association, held its annual show last week.

The heaviest snow storm in years recently visited all parts of Western Oregon.

The next Idaho State Dairy Convention will be held at Caldwell, Jan. 10 and 11.

The Oregon State Dairy Association held its annual session in Portland last week.

Oregon won the grand prize for the general educational display at the A-Y-P Exposition.

Four thousand acres of land were thrown open to entry near North Yakima the first of this week.

Owing to unfavorable season, the seeding of winter wheat in Eastern Oregon is lighter than usual.

The Washington Association of Livestock Breeders will hold its annual meeting in Spokane, Jan. 4 and 5.

One hay buyer at Ellensburg, Washington, has cornered the hay in that market and is now demanding $22 per ton.

Fruit growers on the Clarkston Flat near Asotin, Washington, have combined for mutual benefit in marketing fruits.

The Y. M. C. A. of Portland, Oregon, is conducting a class in poultry under the organization called Portland Junior Poultry Association.

The management of the Inland Empire Poultry and Pet Stock Association promises a thousand entries at its second annual show at Spokane, Jan. 11 to 15.

At the recent meeting of the Oregon State Horticultural Society, walnut growers had a warm discussion as to whether seeded or grafted stock are to be preferred.

Hardware men in Boise, Idaho, have endorsed the proposition of Senator Borah for the issuance of $30,000,000 worth of bonds to complete irrigation projects.

The Spokesman Review of Spokane says that the poultry industry of that section must be fostered and more poultry produced in order to stop the sending of vast sums to the Middle West.

The convention of members of the farmers union at Moscow, Idaho, recommended the establishment of a central agent for the furnishing of daily market reports to agents and individual farmers.

The Educational and Co-operative Union in its session at Pullman, Washington, rescinded its acceptance of proposition to hold its next convention at Colfax, because of that town voting to retain saloons.

The management of the National Apple Show held for two years at Spokane, is discussing as to whether the next show shall be held in that city or transferred bodily to Chicago or some other Eastern city for the sake of the additional advertising to be secured.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90. 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

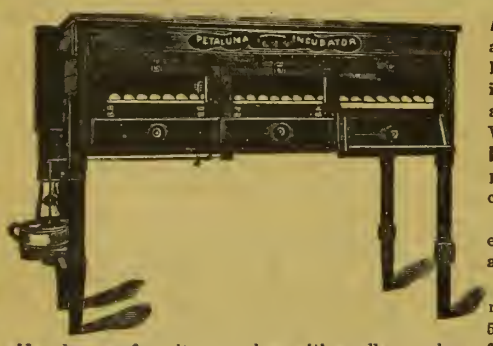
$2.60 FREE. If you will send us the addresses of ten persons who have any fowls, we will send you, post-paid, our Biddy Booklet and an article worth ten cents, which many say no household should be without. If you will send us twenty-five addresses, we will also send you The Poultry Manual, profusely illustrated, by those high authorities, F. L. Sewell and Ida E. Tilson, a reliable work worth fifty cents, but free to you. For 100 addresses we will also send free, and expressage prepaid, another most useful article which sells in the East at $2. We merely want to send to them, by mail, some advertising matter, but your name will not be mentioned in connection with it in any way.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

## Petaluma Incubator Company

**Petaluma, Cal.** **Indianapolis, Ind.**

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### THE LOWLY HEN.

I'm for the hen, the lowly hen;
She lays an egg today and then
Tomorrow goes about her biz
And where her nest of rubbish is
Lays us another. Cluck on cluck,
Day after day with endless pluck;
Happy if in solitude.
She may at last hatch out a brood
Of fluffy chicks with yellow legs,
To become hens and lay more eggs.

She knows no holiday at all,
Nor Sundays. At the clarion call
Of Mr. Rooster, with a lurch,
She lunges down from off her perch,
And, once upon a footing firm,
She goes to hunt the early worm.
She takes a worm, a piece of grit,
A bug, and makes an egg of it
That will pass muster until met
In scramble, fry, or omelet.

Egg after egg, day after day,
In unobtrusive cheerful way,
And, when her laying day is done,
She lounges not in shade or sun,
But with a rush that rest doth mock
She lays her head upon the block,
And, the piece de resistance of
Some boarding house feast, shows her love
For humankind in death. Brave hen!
Example for roosters and men!
—Judd Mortimer Lewis in "Collier's."

### EGG EATING IN FLOCK.

AT THIS TIME of the year many of the pullets have already begun their laying. Yet a very great, if not the greatest number, are yet to begin. It would not be too late we think to make a timely suggestion, especially to those persons experiencing their first year in raising chickens and also those who have made considerable increase in the number of chicks raised this year.

Provide nests for your pullets which they can use as they come to laying maturity. Don't just put boxes around in the yard, hen house or wherever it may be, as I have noticed done at times. Have something more like a nest with soft straw, hay or whatever it may be on the bottom, so that the eggs are not liable to be cracked and broken as laid. Your failure to do this will be apt to get your pullets started in the egg eating habit.

Once they have acquired that habit they are practically worthless as layers. It is contagious. One offender can start the whole pen or flock. They seem to let each other know in some way so that it spreads from hen to hen and yard to yard if you have them separated.

An egg is broken. They taste and learn how good it is to eat. First thing you know they are breaking them. Eggs laid outside of nests or in such open nests that they are easily gotten at will often tempt the hens to peck at them. If the shell is not strong and breaks, the egg will not remain uneaten. It is often difficult to detect that eggs are being eaten by hens. It will take very close watching to discover the habit some times. Then again you may see the evidence in nests where they have not been able to make a clean job.

It is far wiser and easier to prevent the egg eating habit, for rarely can you break it once started. That has been our experience. We have worked day after day trying all kinds of remedies: placed china, or glass eggs, handy for they to pick at; cut their beaks; removed white and yolk, filled shells with red pepper, mustard, aloes, etc.; built special nests so that eggs would roll out of sight after laid, and other things without success in stopping it. Then we tried to gather eggs oftener, but the egg eater preceded us many times. So we finally came to the conclusion the the axe or off to the market was the best way to treat the egg-eaters. They got started with us because proper nests had not been provided which they could use as they began laying.

It is best to have your nests up off the ground and so made that eggs will not be in the light when in nest. An ordinary box can be used. Nail piece across top on one side or end about one-fourth or one-third size of top. Then set the box with that side or end on a broad shelf so that opening is toward wall, allowing space for hen to get in between wall and box. Such a nest need not be nailed fast to shelf but can be turned when you take eggs out or removed to clean, The strip that you nailed on will keep nesting material in.—Henry Langenschwadt, San Jose.

### POULTRY QUERIES.

**Partridge Rocks.**

Is the Partridge Rock a new breed? From what source do they derive the red?—L. B. S., Fair Oaks.

Partridge Plymouth Rock is a new breed and generally accepted as single comb sports from the Partridge Wyandottes, which were made from the Partridge Cochins, Golden Laced Wyandottes, and Golden Hamburg crosses.

### FEEDING LAYING DUCKS.

It should be the aim of those who require early ducklings for the market to have stock birds in full lay by the end of October or the first of November.

In order to accomplish this, the feeding during September and October must be carefully attended to and a nutritious rather than fattening food provided for the birds. By this time last year's ducks should have quite overcome the moult, and should have their full complement of feathers.

As far as possible an abundance of exercise should be allowed the birds, and this can only satisfactorily be arranged when a free range is provided. The chief danger of confining them is that under such conditions they are liable to add on flesh too quickly, and on no account should stock ducks be fat.

The difficulty can, of course, be overcome by feeding very sparingly upon somewhat bulky foods.

Two meals a day will be found quite sufficient, one first thing in the morning, and the other about 3:30 or 4:00 in the afternoon.

Soft food should be provided for the morning meal; and a mixture during this and the succeeding month, which we have employed with success, is two parts of middlings, one of barley meal, one of bran and one of brewers' grains.

At first there may be a slight difficulty in persuading the birds to eat the last mentioned, but they speedily become accustomed to the flavor and eat it readily.

A mixture such as this will keep the ducks in good store condition, and will assist egg-production at the proper time. No hard or fast rule can be laid down as to the actual amount of food to be supplied, as this varies with the breed, and the conditions under which the birds are being kept, and with the season.

The only thing to do is to periodically examine them, and, if too fat, reduce the quantity of food; if too lean, increase it

The mash should be given to the birds not in a sloppy, but a crumbly, moist condition. In the former state too much unnecessary water has to be taken into the system.

The soft food should always be supplied warm.

For the afternoon feeding either hard grain or mash may be supplied. Personally I prefer the latter, but many breeders are in favor of the former. Should grain be provided,

**Feed your Chicks**

**Coulson's**

oats are the best for the purpose, which should be scattered upon the drinking water.

Good sample oats must be used, as otherwise there is too much husk. If mash is employed—and the two may be fed on alternate days—the same mixture as that for the morning feeding will answer well.

If the birds are becoming rather too fat, the proportion of bran should be increased, and the barley meal decreased.

The soft food should always be fed from a trough, otherwise so much is trampled on and made unfit for consumption.

A little lean meat is very beneficial for stock ducks, and should be mixed with the morning feed for mash. Granulated meat, or butcher's refuse, boiled and chopped up, answers the purpose admirably.

The latter gives equally as good results as the former, and is considerably cheaper. Green food should be given liberally to the ducks when they are kept in confinement, those at liberty being able to obtain sufficient for themselves.

When green food is scarce, turnips, swedes, mangels or potatoes form an excellent substitute.

The ducks at liberty can of course procure all the drinking water they require for themselves, but those in runs must be well supplied.

It is unadvisable to allow them to drink a large quantity immediately after eating, as this causes a large portion of the food to pass straight through the body.

Half an hour after they have eaten, however, they may have all they want.

## KILLING AND DRESSING FOWLS.

All fowls should be fasted from 24 to 36 hours before killing. Where this is not done the food decomposes in the crop and intestines. The result is that the flesh becomes tainted and does not keep well.

There are two methods of killing that are considered proper. One is to kill by bleeding in the mouth. This is done by inserting a sharp knife and cutting the veins just below the ear on both sides of the head and then sticking the point of the knife through the brain.

If this is done in a proper manner it will have the effect of loosening the feathers.

The other method is by pulling or wringing the neck. This is done by taking the chicken in the hands, stretching the neck, holding the crown of the head in the palm of the hand and giving a turn backward and at the same time a steady pull.

The head will sever from the neck, leaving only the outer skin. This method is favored by some, but owing to the blood clotting in the neck a discoloration takes place, and where the chickens are placed in cold storage this is a serious objection.

After the bird is killed plucking should begin at once. Care should be taken to keep the head downward to allow the blood to drain out of the body.

Where the birds are allowed to become cool before being plucked, it is very hard to avoid tearing the skin, and the plucking is much more tedious.

Two inches of feathers should be left near the head. A cord is suspended from the ceiling, on which a medium size nut is fastened. This cord is looped around the legs and the nut passed over the cord next the legs. This will hold the bird in place without tying.

After the bird is killed, a sharpened S-shaped wire is inserted through its bill. On this is hung a small pail which serves to hold the bird in place and catches the blood.

The pail should be filled one-half full of water to add weight. After the chicken is plucked it may be placed on a shaping board. This gives the chicken a compact appearance.

If chickens are hung up by the legs after being plucked, it spoils their appearance, making them look thin and leggy.—Farm World.

### THE APPLE.

Then let us sing the apple's praise,
And loud the song of triumph raise.
Fall keepers from the cellar, we
May place beside those from the tree.
The Russet, picked by careful man,
Extends its hand to Astrachan;
Or noted Baldwin, kept by you,
Says to the Primate, "How d'ye do?"
The early Harvest, sour and sweet,
Old Cooper's Market come to greet;
While Rawles' Janet, though worthless here,
In lower climes will keep a year.
In 'Old Kentuck," Missouri, too,
Ben Davis heads the list for you.
While down in Arkansas, 'tis said,
They swear by that Kentucky Red.
Old Empire in her hand will bring
That famous Tompkins County King,
Or say to us, "'twill keep you nippin'"
To beat our noted Newton Pippin;
And then for cooking, or an eater,
Rhode Island brings in her "world beater;"
This apple you will surely find
Is known to all the woman kind,
While Ortly, from New Jersey's limbs,
Has twenty-seven synonyms.
The "Blue Hen" also makes us hush,
And holds aloft her "Maiden's Blush,"
Whose name is most appropriate,
And worth—we cannot overrate—
Which in its season "leads the van;"
Go try and beat it, if you can.

—Green's Fruit Grower.

### "PEDIGREED SCRUBS."

This phrase, borrowed from Mr. Hawk, who made use of it in connection with dairy stock, at the recent meeting at the University Farm at Davis, and commented on by the Cultivator of November 4th, is equally applicable to plants. A pedigreed variety, to be scientifically correct, should have known parentage, but the fact remains that any plant breeder may, by crossing or hybridizing, produce a really pedigreed variety which at the same time is worthless for all practical purposes, however much the originator may value it, who is, by the way, very much apt to judge partially.

When the writer, some years ago, used the term "pedigreed" in reference to "selected" or "up-bred" fruits, he was called to account by one of the well known agricultural professors at an Eastern university. It is simply a matter of the coinage and use of some new word to fit the case. Plant breeders are adopting the term "pedigreed" to signify a "selected" type, which has been bred up by nature's process. To make use of the word "select" or "selected" would be meaningless, or at least, capable of very wide interpretation. Prof. L. H. Bailey has written at length on tbe subject in his "Plant Breeding," also Prof. Webber of the Department of Agriculture, and others.

There is no doubt that the term will be, and is, misused, as a catch phrase by unreliable men; that may happen in connection with any calling, coming under the general head of "graft." We don't want "pedigreed scrubs" among our fruit trees or plants anymore than among live stock. Fruit-growers, by noticing and marking any trees that show marked superiority from whatever cause, or of whatever kind, will assist greatly in bringing about a higher standard of excellence in the products of our orchards and farms, and will be cooperating with the field operations being carried on by Prof. Ralph E. Smith in our own state, and by the Department of Agriculture generally. It only then remains for them to insist on the nurserymen propagating from such trees.—Leonard Coates, Morganhill.

### STORAGE AND TRANSPORTATION INVESTIGATIONS.

(Continued from Page 335.)

fornia. The fruit is hauled to the storage rooms direct from the vineyards and held loosely in small field boxes. The growers have learned to handle carefully in picking and culling and the grapes are placed in storage as soon after leaving the vine as possible. The varieties used are Flame Tokay, Muscat, Malaga, Emperor, Verdal and Ferrara. Th first two are held in nice condition for Thanksgiving and the rest for the Christmas market.

#### Transportation Investigations.

The plan of the work consisted [illegible] forwarding a number of crates a[illegible] boxes of grapes, packed under known conditions through to New York where one of the Bureau staff received the fruit and carefully inspected it. This inspection consisted in cutting apart all bunches and segregating the decayed and injured berries and determining the actual percentages by weight on the day of arrival, and three, five, and seven days after arrival. Last year twenty-two shipments were made. This year thirty shipments were put through. In each car there was an experimental series consisting of eight crates or boxes; two were the ordinary commercial pack, two were a careful commercial pack put up either by ourselves or a careful packer working under our supervision. In tbis careful pack we attempted to do nothing more than to be sure that the bunches were carefully culled and placed in the basket without further injury. All the careful packs were put in two-basket crates. Along witb these crates were two boxes each of the same fruit packed in ground cork and redwood sawdust. One crate or box of each pack was placed on the bottom tier of tbe car and one of each on the top tier. In each car, therefore, we had the same fruit handled in different ways, thus eliminating all factors except the handling. This year we have obtained data on tbe equivalent of about 250 crates, or sufficient to place the work on a practical basis.

An examination of the decayed or moldy berries cut from the various lots shows that fully 95 per cent of the decay started at the pedicel or point where the stem and berry join. Tbis is the weakest point of the grape berry and the slightest crack or loosening at that place will allow tbe mold spores to gain entrance and start the decay. With the larger fruits it is comparatively easy to detect injuries and to eliminate tbem; grapes are not only more easily injured but the injuries are more difficult to detect. The necessity for care in handling grapes becomes therefore doubly important, not only in the packing, but in the picking and all handling operations. The handling should be reduced to a minimum, for every time a bunch of grapes is lifted there is liability to injury unless it is done with the utmost care.

It will occur to some that grapes grown under different conditions (soil or otherwise) or from young vines, will vary much in their keeping quality. This is undoubtedly true. Our records, however, are based on shipments made from sandy soil vineyards, from heavy soil vineyards and old and young vines. We have eliminated to a large extent the effect of these factors. Where fruit is tender and more liable to injury, it must be all the more carefully handled. We have had some lots from old vines show more decay than younger and some heavy land fruit show heavier decay than corresponding lots from sandy soils. Moreover, in our carefully handled series and cork and sawdust packs we have used the same fruit and thus are able to show that even the weaker fruits, carefully handled and uninjured will not decay other things being tbe same.

It naturally follows that it will cost more to handle carefully—just how much more it is impossible to say but it will vary with the quality of frult and the season. But will it pay, many will ask. During a season of low prices, at first sight it may seem unreasonable to advocate the spending of more money on packing. That careful handling will pay, and pay well, has been demonstrated again and again in the orange business. We have seen a number of associations and individuals rise from among the lowest priced class to the highest priced class as soon as more care was used in handling, thereby reducing the susceptibility of their fruit to

rot. Increasing the cost of handling a few cents per box, thus insuring sound fruit, has in some cases increased the average return from 25 to 50 cents per box, leaving out of consideration the value of the reputation thus gained. The question now in the citrus business is not how cheaply can the work be done but how well. It has been recognized that cheapness places a premium on careless work. What is true of citrus fruits will be found equally true with grapes. And if the grape business ever gets to the point where the difference of a few cents per crate spent in good handling becomes the margin of profit or loss, it will cease to be a safe business investment.

The best answer to the question of whether careful handling is practicable or profitable is shown by the fact that a number of growers are handling carefully and are getting good results. When the marketing problems have been systematized, much better results will follow.

The shipping experiments conducted at Lodi were accompanied by a series of local demonstrations in order that the growers might be able to see the results of the work. A refrigerator car was held at Lodi and kept fully iced during the shipping season. A duplicate of every series shipped to New York was placed in the car and held there until the shipment arrived at destination. The lots were then taken out and placed on exhibition and the growers were thus enabled to observe the differences found in the different packs. Along with these a number of growers contributed crates from their commercial packs in order to be able to judge of their appearance on arrival, and in some instances to determine the kind of work their packers were doing. This campaign of education among the workers has resulted in a marked general improvement in the commercial pack of the district during the season just closed when compared with the season of 1908. The first year that the work was carried on it was not uncommon to find a large part of the decay due to crushed berries on the top of the pack made in pressing on the cover. During the last season this difficulty was largely overcome by using more care in nailing on the covers and by extra cleating.

Our investigations during the past season show that there is at least one mold which has the power, under certain conditions, to penetrate the unbroken skin of the grape berry. This is a species of Botrytis, probably B. cinera, and is undoubtedly the cause of the so-called 'slip-skin" found after the rains. The "slip-skin" is the early stage of the decay and unless every berry showing this is culled out, it will decay no matter how carefully the handling may be done. This disease gives very little trouble before the rains come, but after a rain the crops of many vinepards are practically ruined by it. It is wholly distinct from the cracking of the berries.

It is easy to see that if there were few or no spores of the Botrytis when the rain comes, there would be little or no trouble from this decay. This is a pathological problem, and points to the control of the fungus in the vineyard either by spraying or some other remedial treatment of the vines. The life history of this fungus on the vine has not been fully investigated and until it is, it will be impossible to state the exact means for its control. This is a most important phase of the problem, and if the work of the Bureau is continued in California, we hope to have a complete pathological study included in the investigations.

In conclusion it may be stated that the results obtained during the past two seasons are very encouraging. The relation between handling and the occurrence of decay is as striking and consistent as the results of the orange investigations in Southern California which have led to the practical elimination of decay in transit. The indications are that by careful handling in packing, accompanied by some method of quick shipment or cooling the present losses from decay may be largely avoided.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Grape Pruning.

I have 100 Emperor vines planted on heavy land tending toward adobe. I have trained to stakes four feet high and pruned side vines to two buds and top vines same way. They are tremendous growers, but do not bear well. How can I improve them in this respect? Is the soil too rich? Missions, muscats and hamburgs planted near all do well.—W. T., San Dimas.

In regard to the Emperor vines, I would give them a little more wood, as the fact that they make so much wood rather than fruit indicates the pruning is rather too heavy. The vine cannot have too rich a soil as it is a heavy feeder. We would have these vines up here on five foot stakes with seven or ten spurs of three buds each or else they would be trellised to as much if not more spurs. Pruning is only a way of making a vine fruitful and manageable and if we overprune, the vine will either die or make too much wood. Each vineyard is a law unto itself in this, but it is safe to consider when the wood growth of a fruiting plant is too great that the pruning has been too severe and the plant is trying to overcome it.

### Olivile.

Answering query sent sometime ago by subscriber, the Braun Chemical Co. of Los Angeles states that the bitter principle in olives is called olivile.

### Date Culture.

What success has been attained in date culture in Imperial Valley and in the San Joaquin Valley?—E. B., Visalia.

In both valleys dates of remarkably fine quality have been produced, but so far as we are informed this industry is yet in an experimental stage. In the Coachella and Yuma sections there have been extensive plantings, but to say that they are a success would be to express a hope rather than a proven fact. Will subscribers in these valleys who know of successful date production inform us.

### Marketing Fresh and Dried Fruits.

It there or should there be any difference in methods of marketing fresh and dried fruits?—E. B., Visalia.

That would depend upon circumstances. General principles governing both are, of course, the same, but a glutted market might make it wise to follow different methods with dried fruit, which can be held while fresh fruit must take whatever the market offers when it is ripe. Some producers of fruits, grain, or whatever it may be, hold as a religious principle to the selling of products as soon as they are ready, claiming that year in and year out, quick selling has the advantage, but a question such as this requires vastly more space than is available in the query department. In fact, it would take volumes to answer it properly.

### Buttermilk for Hens.

Does feeding buttermilk to chickens harm them?—W., Santa Ana.

We cannot see wherein there would be any injury, and understand it is generally considered a fine feed for the flock.

### Dried Olives.

A subscriber at Riverside has not found satisfactory results from the method of olive drying given by Mrs. Williams in our issue of Oct. 14th. From Mrs. Williams we have received a letter touching upon this point, in which she says she would not exchange a quart of properly dried olives for a gallon of the ordinary pickled ones. She says, however, that there is sure to be some of the bitter principle left, which, if one did not like at all might make it impossible to appreciate this method of handling olives. She adds: "I think it would be wise for producers to prepare the olives in both ways so that the people who do not like the flavor of the dried olives may have the other." Mrs. Williams compares this bitter with that of grape fruit which is to a certain extent a tonic and, properly prepared, is becoming almost a necessity on the American breakfast table.

### Destroying Stumps.

I have a row of eucalyptus stumps a half mile long, stumps averaging from nine inches to a foot in diameter. They were cut level to the ground five years ago and while some of them are rotting, the majority are still solid. Can you tell me of a way of burning them?—Stumps, Oxnard.

Had the stumps been taken when trees were first cut and holes bored in the tops and filled with saltpeter, it is claimed by some that the stumps burn as soon as dry, and that this burning will remove even the roots. Others prefer to let them dry as yours have done, then bore holes and fill with kerosene. After a few days this kerosene will be so absorbed that when a fire is built on the stump, it continues to burn until it is consumed. In practice, however, nothing is so satisfactory as grubbing out the roots.

### Hard Milkers.

I have a grade Jersey that has always been a good milker until this year. She has been fresh about a month and two of her teats, on the right side, seem to have "shut off valves." It is with difficulty that I can milk her, and have to use milking tubes. Is there some method of correcting this?—O. P. O., Porterville.

Write to O. J. Weber Co., 225 E. 6th St., Los Angeles, for their hard milking outfit. Mrs. Sherman says, however, that she does not think it well to use anything of this kind on a cow in full milk as it is hard to secure proper healing of the cut. Application of hot compress might allay a possible inflammation which causes the hard milking.

### Broom Corn.

Will broom corn sprout from the root and make a profitable crop the second year after planting in this locality?—R. L. B., San Jacinto.

I would have to try this to know, as all corn plants are supposed to be annuals. The Amber Sorghum will grow from year to year if it is not allowed to form seed and if it escapes the winter's frost. The making of a heavy crop of seed will stop its growth at once no matter what the season of the year is up here. I should not be very hopeful of being able to cut a crop of broom corn and then have the plant grow again. As a plant it has accomplished its purpose in life and is really according to the laws of life ready to go out. Try it, however, if only in a small way. California is so wonderful a country that we never know what the climate and soil will do for us.—M. E. S.

### Peach Blight.

My peach trees have a gummy substance that comes out through the bark on both old and young trees, and seems to be killing them. I have sprayed with Bordeaux mixture but cannot see that it helps them.—G. H., Fresno.

Peach Blight of course. The spraying must have been done at the wrong time for we have sprayed with great success for the past years. We use 4 parts of blue stone, 6 of lime and 40 of water. Be sure the blue stone is blue in color for that is the copper. I am sorry to say that there are a good many cases where green stone, sulphate of iron, instead of blue stone, sulphate of copper, is given to the fruit grower by the store keepers. Sometimes they are told it is just as good. In making the Bordeaux, good lime also is necessary, then take care in making it. So many do not dissolve the bluestone completely. It must be dissolved by having it in bags in half the water, a few pounds in a piece of sacking hung on a nail at the top of the barrel and it will fall as it dissolves to the bottom of the barrel. Then use the other half of the water to slake the lime, making it smooth and milky water of lime. When it goes into the spray tank have two men to pour it in mixing the two streams of liquid as it flows into the tank. Then stir it as it is put on the trees. Time too is a feature. If the spraying is not done by December 15th the efficiency is nearly 50 per cent less. We usually have the spraying done in November to be on the right side of things. The trees may be pruned in the first week of November and the pruners will keep ahead of the spraying. Haul out the heavier brush and the lighter will not interfere very much with spray tanks. The peach orchards are becoming affected generally and for that reason new people are discouraged over the planting. It will pay handsomely I think in the next few years to grow peaches as they will not come in as fast as they are needed. The canners have all had to prorate their peach orders this season. That means no carry over for next year.—M. E. S.

### Wheat for Hogs.

I wish to know the best way to feed wheat to hogs for fattening purposes. When fed dry a portion of it seems to pass without being digested.—J. S. S., Fresno Flats, Madera Co.

I presume this questioner has no way of grinding or no way of selling this wheat. Wherever there are chicken feeders a good market can be found for shrunken or inferior wheat that makes it more profitable to sell than to hold it for pig feed. The difficulty of the stock passing it whole may be readily overcome by soaking the grain long enough to swell and soften it. Water, milk or butter milk may be used for this purpose.—M. E. S.

### Cause of Abortion.

I had a cow bloat on alfalfa a month ago. The second day after she bloated she lost her calf. I gave her soda to relieve the bloat, would that cause this? It was her third calf, have never had any trouble of the kind before. She was within five months of calving time. How soon would it be safe to breed her again? This happened a month ago.—A Subscriber.

No, I would rather think the severe pain of bloating was the cause. If there is no discharge it is hardly likely to prove more than a mishap, not of a contagious nature. I would pass over one period of heat and then before breeding her inject warm soda water, tablespoonful of baking soda to a gallon of warm water. Do this half an hour or so before breeding her. Any time within a couple of hours will answer for the purpose.—M. E. S.

### Preventing Breeding of Flies.

You have said in the Cultivator that the use of gypsum prevents the formation of odors in stables, and I wish to ask what will be its effect on preventing flies from breeding, or is there an other chemical which may be use for this purpose?—A. C., Folsom.

In his address before the State Fruit Growers' Convention on Insects As They Relate to Rural Hygiene, Prof. Hermes of the State University said that the purchase of insecticides for continued use on manure piles is a matter of no small expense. There are two classes of remedies which he recommended, contact poisons and

stomach poisons. To the first class belong kerosene emulsions, creosol preparations, and chloride of lime; to the second class belong the arsenicals such as arsenate of lead and Paris green. Unfortunately, these are not only expensive, but can be used with no degree of safety to domestic animals. Prof. Hermes recommended as the only preventive of flies, absolute cleanliness so far as possible to be secured about the stables.

### Chicken Manure.

How does one ton of chicken manure compare with one ton of commercial fertilizer for orange and lemon trees?—W. H. H., Ioamosa.

Approximately its value is about five dollars a ton. From an article by Mr. Mills in Cultivator of Sept. 10, 1908, we quote: "Analyses show that on an average 100 pounds of fresh poultry manure contains .05 pounds of phosphoric acid, .56 pounds potash, 1.10 pounds nitrogen." It is a valuable by-product and should be preserved most carefully. It is excellent on orchard trees. Because of the quantity of silica contained in this form of manure it is more profitable to use fresh from the poultry houses and as quickly as possible incorporate it with the soil. The free silica hardens when the manure is allowed to dry and makes a proportion of the fertilizer unavailable

### Bougainvillea from Cuttings.

Will the bougainvillea grow from cuttings, and when should they be slipped? Should camphor seed be dried or planted fresh?—Subscriber, El Modena.

The magenta bougainvillea is easily produced from cuttings which should be made whenever the plants are dormant. The lighter rose colored variety is a different proposition, and while it is produced from cuttings, it is much more difficult to grow. Camphor seed will give better results if planted fresh.

---

Where dairies or butter factories are, or where the milch cow is a factor for other purposes than the sale of milk as such, the pig is a most useful and profitable adjunct. Upon the skim milk, judiciously used with other and more substantial foods, he thrives, grows and fattens, utilizing a by-product of tremendous volume which without the pig would represent little of available value. It it said that the skim milk from the butter factories of New York alone amounts to nearly a billion pounds in a single year. The use of this skim milk does much to give relief from monotony so common in the hog's feeding, besides adding to the returns from the other or main foods with which it is given, and every hog-raiser is glad to have it.—From Coburn's "Swine in America."

# Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

## TREES.

CITRUS NURSERY—Township of Glendora, corner of Gladstone and Ben Lomond avenues, half-way between Grand avenue and Citrus avenue. We have for sale orange and lemon trees suitable for planting in the coming spring, Navel Oranges, Late Valencias and Eureka Lemons. In growing these trees we have used much care in selecting the buds from the choicest trees only of the surrounding orchards. L. M. NETZLEY, Azusa, Cal. Phone 4095.

## A CHRISTMAS RHYME.

Glad Christmastide is drawing near,
A poem I'll indite,
Wherein is fitly eulogized
This season of delight;
Methinks I can portray it well—
A task oft done before—
And yet how strangely halts my pen,
My ready pen, of yore!

Now, something in this good old style:
Across the trodden snows
The sleighbells ring a merry tune,
As, dashing to and fro—
But what's the matter with my muse?
She doesn't come to time!
The semi-tropic's genial warmth
Inspires no Christmas rhyme.

From open window I can see
A garden, all aglow
With bud and bloom, 'mid verdure set—
How can I theme of snow?
The breezes, blowing through the grove,
Sweet with a rare perfume,
Soft as the winds of Araby
Suggest not winter gloom.

I'll try again: The fuel bring
And heap the grate the higher;
Let storms unceasing rage without,
We'll gather 'round the fire—
Oh, bosh! Why prate of Boreas' pranks
When like a lamb lies he?
Ill get me to some sylvan nook
In this our Italy.

—J. Torrey Connor, in Sunset Magazine.

## CHRISTMAS IN THE FARMHOUSE.

WHEN a child you read stories of Christmas celebrations where houses were decorated with holly and mistletoe and the people had such jolly times putting them up, didn't you look around your own house and wonder how that would look if trimmed with those same greens? And didn't you long to smell their spicy fragrance and to have a hand in putting them up where you thought they would look the best? And didn't you long to feel that peculiar Christmas spirit that is in the very air in cities and villages for more than a week before Christmas Day itself? And then did you just settle back and say, "Well, it's no use, as long as I live on a farm, Christmas must be just the same as it always has been—an exchange of gifts and an unusually big dinner?" Now I want to tell you that you are mistaken—that you can have just those very same things, even to bringing in the old-time Yule-log, if you are so fortunate as to have an open fireplace in the farmhouse.

City people pay from twenty-five cents to one dollar and a half for wreaths of Christmas greens to hang in their windows. You can easily make them at home by using a cardboard foundation to keep your wreath perfect in shape, and they can be made out of any kind of evergreen, even from the ordinary hemlock boughs. A few sprays of holly or any red berries may be added, but a plain green wreath tied with holly, red ribbon or even red crepe paper brings pleasant Christmas thoughts to every one's mind. The festooning sold in the cities costs from twenty-five cents a yard up, depending on the quality and size; but you will obtain very pleasing effects by using the natural sprays. Even a stair rail may be wound by simply twisting the end of one spray about the beginning of another. But the regular festooning may be easily made by winding with a heavy twine. It takes but a little time to do this, and you will find such joy in it that it will not seem like work.

There is an immense trade in the cities in Christmas ferns for table decorations. Did you know that those beautiful ferns were nothing but the ordinary woods ferns? They are gathered, smoothed out perfectly flat and tied in bunches. A number of bunches are laid carefully on the ground in a pile and covered with leaves and hemlock boughs and left until they are shipped to the city for the Christmas trade. Couldn't you do that, and, furthermore, have ferns whenever you wanted nearly all winter? Few country people appreciate the real beauty of ferns or realize how much money city people spend for them.

City people pay from thirty-five cents to a dollar for a small house Christmas tree, and every one who can afford it buys a tree every year for his children. How often do farmers' children have trees? And why not? Because the parents say: "We haven't gifts enough to make a pretty tree." Many people never put a gift on—simply make it a tree of beauty for the children. Strings of popcorn, wishbones and canes gilded, gold stars—anything bright and shiny hung on a tree delights a child—a bag of popcorn with a few candies in it tastes five times as good if it has only once hung on a tree. Even if the gifts must be underwear, shoes and things actually needed to wear, have them come as surprises and in as "Christmasy" looking packages as possible. Keep the Christmas spirit in the home.

It seems a pity for us country people, surrounded by these beautiful things deemed luxuries by our city friends, to make no use whatever of them and to let our lives become so commonplace. Christmas is not solely a day for gift giving and receiving and eating; it is a day for doing everything in your power to add to the joy of the children—a day to remember the feeble and lonely old people—a day to think of the strangers and the poor. If you haven't money to spend for gifts for them, you can give some of yourself and of your own home Christmas cheer. There are homes that it is an inspiration to enter because of the Christmas spirit they breathe forth. I trust the farm homes will not be lacking in Christmas beauty or Christmas cheer—that all of them will truly "keep Christmas."—Country Gentleman.

## "A MERRY CHRISTMAS."

The Christmas chimes are pealing, softly pealing; the joyous sounds are ringing, ever louder and clearer, ever nearer and nearer, like a sweet-toned benediction falling on the ear. Glad ringers are pulling the ropes, and in one grand swell of melody Christmas with its old yet ever new and marvelous mysteries, bursts triumphantly upon the world once more.

The cattle have turned their heads to the east and knelt down to worship the king cradled in the manger; the houses are decked with holly, the yule-log burns brightly; the gray shadows sweep away; the sun is up and the bright-eyed children, who have lain awake all night listening for the patter of old Saint Nick's tiny steeds on the roof only to fall asleep at the eventful moment, wake hurriedly to find the stockings running over with toys and sweetmeats.

Beautiful and right it is that gifts and good wishes should fill the air like snowflakes at Christmas-tide. And beautiful is the year in its coming and in its going.

I do not know a grander effect of music on the moral feelings than to hear the full choir and the pealing organ performing a Christmas anthem in a cathedral and filling every part of the vast pile with triumphant harmony.—Washington Irving.

Teacher (to boy who was invariably late to school)—Why, Johnnie, are you on time at last?

Johnnie—Yes, teacher, at last I am before; I've always been behind before.

**It pays to know**

Trinidad Lake Asphalt is nature's perfect waterproofer.

**Genasco Ready Roofing**

is made of Trinidad Lake Asphalt. You know it will last and give your roof absolute protection.

## CORNED BEEF RECIPES.

A subscriber at Imperial wishes appetizing ways of serving corned beef. The regulation slicing cold is less relished in time and new ways are desired. Will our readers send in new ways? Here is information as to boiling, also a luncheon recipe for a starter.

### Boiled Corn Beef.

Soak over night if very salt, but if beef is young and properly corned this is not necessary; pour over it cold water enough to cover it well, after washing off the salt. The rule for boiling meats is 25 minutes to a pound, but corned beef should be placed on a part of the stove or range where it will simmer, not boil, uninterruptedly from four to six hours, according to the size of the piece. If to be served cold, some let the meat remain in the liquor until cold, and some let tough beef remain in the liquor until the next day, and bring it to the boiling point just before serving. Simmer a brisket or plate piece until the bones are easily removed, fold over, forming a square or oblong piece, place sufficient weight on top to press the parts closely together, and set where it will become cold. This gives a firm solid piece to cut in slices, and is a delightful relish. Boil liquor down, remove the fat, season with pepper or sweet herbs, and save it to pour over finely minced scraps and pieces of beef; press the meat firmly into a mould, pour over it the liquor, and place over it a close cover with a weight upon it. When turned from the mold, garnish with sprigs of parsley or celery and serve with fancy pickles or French mustard.

### Luncheon Corn Beef.

Thin slices corn beef; 1 tablespoon butter; 1 tablespoon flour; 1 tablespoon good vinegar; 1 cup of water.

Put into a frying pan the butter and flour; cook, stirring all the while. Add water and vinegar. Lay corn beef in this and cook four or five minutes.

## HE WENT TO SLEEP, BUT—

Recently a friend who had heard that I sometimes suffer from insomnia told me of a sure cure. "Eat a pint of peanuts and drink two or three glasses of milk before going to bed," said he, "and I'll warrant you'll be asleep within half an hour." I did as he suggested, and now for the benefit of others who may be afflicted with insomnia, I feel it to be my duty to report what happened, so far as I am able to recall the details.

First, let me say my friend was right. I did go to sleep very soon after my retirement. Then a friend with his head under his arm came along and asked me if I wanted to buy his feet. I was negotiating with him, when the dragon on which I was riding slipt out of his skin and left me floating in mid-air. While I was considering how I should get down, a bull with two heads peered over the edge of the wall and said he would haul me up if I would first climb up and rig a windlass for him. So as I was sliding down the mountainside the brakeman came in, and I asked him when the train would reach my station. ,

"We passed your station four hundred years ago," he said, calmly folding the train up and slipping it into his vest pocket.

At this juncture the clown bounded into the ring and pulled the centerpole out of the ground, lifting the tent and all the people in it up, up, while I stood on the earth below watching myself go out of sight among the clouds above. Then I awoke, and found I had been asleep almost ten minutes.—The Good Health Clinic.

## HAPPINESS.

He—You remember the moonlit night, twenty-five years ago, when I proposed?

She—Yes, indeed.

He—We sat there for more than an hour, and you never opened your lips.

She—Yes, dear.

He—That was the happiest hour of my life.

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point!"

**MORE LIGHT**

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

**THE ANGLE LAMP**

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

# San Francisco and Los Angeles Produce Markets

## Los Angeles Markets

LOS ANGELES, Dec. 22, 1909.

### Butter.

The butter market is in best of tone and supplies not sufficient for the demand. Quotations exactly as last week.

Produce Exchange wholesale quotations are as follows with actual selling prices to the trade 2½ advance on Extras.

Creamery per roll .....67½@75
Eastern Creamery per roll .....67½
Cooking .....26
Ladles .....26@27

### Cheese.

Northern fresh .....20
Domestic Swiss .....23
Imported Swiss .....32

### Eggs and Poultry.

Storage eggs are being drawn upon heavily, and fresh are picked up immediately on receipt. The rigid enforcement of the pure food law is depressing the demand for storage.

Paying price f. o. b. L. A. is:
Local candied .....48@50
Case count buying price.....45
Eastern fresh .....35
Storage .....26@28

Dealers pay for live poultry f. o. b. L. A.
Hens per pound .....18@19
Roosters .....9@18
Roasters 3 lbs. and up .....18@19
Spring chickens .....18@20
Turkeys .....20@24
Geese .....10@12
Ducks .....10@12
Squabs .....1.25@1.75

### Live Stock.

All prices on live stock are advancing. Hogs are strong at 8c with every promise of a continuing firm market.

The following quotations are f. o. b., Los Angeles on all stock.

Hogs from 175 to 200 pounds.....8
Prime Steers .....5
Heifers .....3½@4¼
Calves per pound .....5
Sheep ewes per head.....4.00@4.25
Lambs per head.....4.00@4.25
Wethers .....4.50@5.00

### Potatoes.

Wholesale prices are:
Sweet per ctl.....1.75
Burbank local .....85@1.00
Highlands .....1.10@1.35
Salinas .....1.50@1.65
Watsonville .....1.50@1.65
Oregons .....1.40@1.50
Oregon Rose .....2.00
Lompoc .....1.65@1.75

### Onions.

Wholesale quotations:
Australian Browns per sack .....1.75
Garlic .....8@10

### Vegetables.

Wholesale quotations:
Artichokes locals .....1.10@1.25
Beets, sk .....80
Beans, string .....9@10
Brussels sprouts per lb. .....8@9
Bell peppers .....6@8
Cabbage, per sack.....1.00
Celery per doz .....50@60
Cucumbers per doz .....1.50
Cauliflower per doz .....40@60
Carrots per sk .....80
Egg plant per lb. .....5@8
Green onions per doz bunches.....25
Hubbard squash .....1@1½
Lettuce choice per crate ....1.25@1.50
Leeks .....35
Oyster plant .....35@40
Summer Squash, lug.....75
Okra per lb. .....8@10
Peas, per lb.....9@10
Parsley, per dozen bunches ....15@25
Pumpkins per lb. .....1½
Parsnips .....40
Radishes per doz. .....20@25
Rhubarb, crimson winter.....1.00
Spinach per doz .....17½
Turnips sk .....80
Tomatoes lugs .....90@1.00

### Citrus Fruits.

Navels .....2.25@2.75
Grapefruit .....2.50@3.50
Lemons .....2.25@3.50

### Fresh Fruits.

Wholesale prices on the market are:
Bellefleurs .....1.35@1.65
Winesaps California .....1.25@1.75
Permains Red .....1.20@1.50
Pearmains W W .....1.35@1.75
Newtown Pippins .....1.50
Jonathans .....3.00
Cider .....1.25@1.50
Casabas per crate .....1.70
Cantaloupes Jumbos..... ..2.50@3.00
Christmas melons .....2.00
Figs .....1.25@1.50
Grapes lug box .....1.25@1.50
Persimmons lb. .....6@8
Pomegranates per lb. .....5
Peaches per box .....1.00@1.25
Winter Nelis .....2.25
Quinces per bx.....1.25
Raspberries .....10
Strawberries .....8@10

### Dried Fruits.

Wholesale prices are:
Apricots .....12@15
Evap apples fy per lb .....10@11
Figs box .....1.25
Peaches .....7@8
Pears .....11@12
Plums pitted .....12½
Nectarines .....9@10
Prunes .....4½@10

### Beans Dried.

Wholesale quotations:
Limas per ctl .....4.40@4.50
Pink No. 1 .....4.40@4.50
Black eyes .....4.75
Lady Washington .....4.25@4.50
Small white .....540@5.50
Garvanzas .....4.50.
Lentils .....7.00

### Nuts.

Wholesale quotations are:
No. 1 soft shell walnuts .....13½@14
No. 1 hard shell .....11
No. 2 soft shell .....10
Walnuts, budded .....18@20

Peanuts, Eastern .....7
Peanuts, Cal .....5@5½

### Honey.

Wholesale quotations:
Extracted water white .....7@7½
Extracted light amber .....6@6½
Comb Water White .....18
Comb, white .....15
Beeswax .....25

### Hay.

Buying prices f. o. b. cars L. A. are:

Hay is in big supply. At this writing a large supply is on the track with demand weakening. The well distributed rains are doubtless cause of the weakness.

Barley hay .....10.00@13.50
Alfalfa, local .....12.50@13.00
Alfalfa Imperial .....11.00@12.50
Northern .....12.00@12.50
Wheat hay .....11.00@13.50
Tame oat .....11.00@15.00

### Grain.

Wholesale selling price f. o. b., Los Angeles:
Wheat, new, per ctl .....2.15@2.20
Kaffir corn .....1.85
Corn .....1.80
Egyptian corn .....1.85
White oats .....1.85
Seed Rye .....2.10
Seed Barley .....1.70

### Feed Stuff.

Wholesale selling price f. o. b., Los Angeles:
Cracked corn .....1.85
Cracked wheat .....1.85
Shorts .....1.85
Bran .....1.60
Cocoanut cake .....1.35
Cocoanut meal .....1.85
Cottonseed meal .....1.25
Oil cake meal .....1.85
Feed meal .....1.90
Cracked wheat .....2.10
Rolled Barley .....1.65

## San Francisco Markets

SAN FRANCISCO, Dec. 21, 1909.

### Butter.

Butter is quiet with supply rather above demand. Quotations stand at exactly last week's figures.

### Honey.

White comb .....14@15
Light Amber .....10@12
Extracted W W .....7½
Extracted light amber .....6½@7
Beeswax per lb. .....25@29

### Hay.

Scott, Magner & Miller say:

Arrivals of hay for the past week have been 2229 tons, as against 2374 tons of the preceding week. As can readily be seen, the receipts are very light, farmers being busy seeding their ground after recent rains, and have not had time to make shipments, and practically everything the past week has come in for dealers account.

Receipts of fancy Livermore hay have been in light supply, and this one commodity has sold in this market for one dollar per ton more than last week's quotations.

Allowing for an equal demand this year to what we had last year, which at the present time is absolutely not in evidence, we cannot look for a greater demand from the 1st of December, 1909, to the 1st of June, 1910, at which time our new crop is available, to exceed 70,000 tons, and as this is comparatively a very small percentage of the amount of hay on hand, we cannot but believe that this market will still go lower, as holders commence to realize that there is a great liability of their being compelled to carry their stocks over into the new year, with the new crop coming on, for which all conditions at the present time are most favorable.

The export demand for the past week has improved, owing to the shipment of 350 tons of hay on a contract for the Post at the Hawaiian Islands, the contract for which was let to our firm last August, this being the first delivery. This hay was baled and held for them for several months past, therefore it has in no wise affected the present market. There has been considerable newspaper talk regarding shipments of hay to other states, but up to date we have had no call for any, other than the usual coastwise shipments which we receive every year.

## Citrus Market

LOS ANGELES, Dec. 22, 1909.

Oranges are going forward more rapidly from all citrus sections of the southern part of the state, while both Tulare and Butte counties are approaching the end of their season. These two sections will practically finish their output next week. One serious factor in the marketing of this season's fruit is the large sizes, which is alrcady shown by the excessive number of 126's and even 96's. The prices being received are satisfactory.

Lemons are still commanding most satisfactory prices. The imports are increasing. Lemons going forward now are of good quality.

**SHIPMENTS.**

Shipments from Southern California to date are 1162 cars, of which 707 are oranges and 455 lemons. To same date last season 1457 carloads of which 911 were oranges and 546 lemons.

The Tulare county section has shipped 2125 cars and the Butte county shipments are running up close to the 300 mark, but exact figures are not at hand.

---

NEW YORK, Dec. 20.—Eight cars navels, four lemons and one Arizona navels sold. Market very steady on good quality navels and strong and active on lemons. Market fairly firm on Arizonas. Clear, cold.

LEMONS—Lemoncove TCC, Lemoncove, $4.50. Tulare, $4.00.

Five hundred thousand acres of arable land in south central Washington will come under irrigation by the completion of a reclamation system projected by ranchers in the Horse Heaven country.

The Union Stockyards at Portland, Oregon, recently purchased one load of hogs at the record breaking price of $8.60.

The aggregate output of the sugar from the Spreckels factory totalled a valuation of $4,095,000.

## ABOUT GRAIN DRILLS.

The question of advice regarding the kind of a drill is a rather delicate affair. It is a question we do not like to discuss in detail. We have had considerable experience with the different kinds of drills. Our early favorite drill was the closed heel shoe drill, meaning by this a shoe drill, the heel of which was not spread out so as to scatter the grain, but on the contrary, made a narrow V-shaped crevice in the firm soil below the mulch where the little kernels were dropped, the shoe being followed by a chain cover, left what seemed to be the most ideal condition for quick germination and rapid growth of the plant. We can recall many instances of marked germination and growth. One, for illustration, was in Chase county, Nebraska, in the autumn of 1903 which had been very dry with no rain for nearly a month prior to seeding. We had prepared by our system of summer tilling an ideal seed bed, the soil being absolutely fine and firm up to the loose mulch. In this ideal seed bed the seed was deposited by the closed heel shoe drill. On the morning of the fifth day, practically four days after the seed was put into the ground, the shape of the field could be seen from its green color a distance of two and a half miles, where a little town was located, the field being on a piece of ground sloping towards the town.

This condition was the result of the quick germination of the seed and rapid growth of the plant because of the perfect condition of the seed bed. Had this grain been put into the ground with a disk drill or a hoe drill, the soil would have been so loose, germination would not have been as rapid. The principal cause of the rapid growth was the fine firm seed bed which promoted rapid and prolific growth of roots.

While this shoe drill deposited the seed in an ideal condition when the soil was perfect, yet there were a number of objections to the construction. First, the draft of the machine was too heavy. It took four good horses to handle an eight-foot machine. Second, if there were any corn stalks or other obstructions in the soil, it would force the shoe out of the ground, thus causing an uneven depth of seeding.

The double disk drill overcomes the two difficulties above mentioned. This is especially true of the Monitor drill, as it is made with two straight coulters, coming together in front, thus permitting the establishing of the same V-shaped crevice in the solid soil. In other words there is no loosening of the soil, the tendency being to pack the bottom and both sides. Because of the rotating motion of these disks the friction is materially reduced. We have two of these drills in use twelve feet in width and four fairly good horses handle them with ease.

The real point to be considered in a drill is that of depositing the seed in such manner that quick germination may be promoted, followed by rapid and prolific development of roots. Those who have followed us through numerous articles on the preparation of the soil must begin to appreciate that very much depends upon the condition of the ground where the seed is deposited, not only with reference to the quick germination of the seed, but that of a continued strong healthy growth of the plant to maturity. Just a thought upon this point should convince the farmer that there is some virtue in the drill we are referring to, for after spending much time and effort to get a fine, firm seed bed, it woud be unwise to use a drill that would again loosen up quite a portion of this.

While it may occasionally be true that a heavy rain follows the seeding, this would of course, result in firming the soil about the kernel and the special stress we put upon this point might not be of much avail, but it is also true that not infrequently no rain follows the seeding, especially in the winter wheat section. We have also seen the same conditions prevail in the spring wheat section. Therefore the great point is to do everything as correctly as possible that we may obtain the quickest germination, the strongest, healthiest growth of the plant, regardless of climatic conditions.—Campbells Scientific Farmer.

## HOW TO KILL WEEDS.

Rotation of crops is one of the best ways to get rid of some weeds; certain weeds go with certain crops. We should not sow small grain unless it is carefully screened in a fanning mill to get out the weeds and weaker seeds.

Weeds teach us that we must cultivate better. It is certainly profitable to cultivate corn as long as weeds are there. Weeds cause great loss of moisture and plant food, they reduce the stooling of small grain, cut down the yield of crops, make the cultivation of the field more expensive, and damage hay and other such crops after harvesting.

Weeds aid many plant diseases as rusts, smuts, and blights, and help to increase the insects. If it were not for foxtail, we could cut off much injury by the corn root louse.

Weeds that are annuals may be destroyed by clean cultivation during their early growth and just before they produce seed. It is better to smother the weeds that have root stalks, as many perennials do. If they are cut off even with the ground or deeper the root can exist for awhile, but cannot live without leaves above the ground. Sometimes weeds indicate an acid soil.

To destroy the wild morning glory or bind weed, turn in the sheep or hogs. Keep these vines cut off above the soil for two years and it will kill the roots. If the ground is plowed one and one-half inches deep in the spring and later six or eight inches deep, this will thoroughly kill them in a dry season. Cut down the morning glories and in August plow and harrow the ground, double discing where the weeds are thickest. This has destroyed them all.

Canada thistles may be gotten rid of by cutting them off every two weeks for two years. One man who has had experience with iron sulphate said that it would destroy porous-leaved weeds like mustard, but he thought it would not do for weeds having smooth leaves. He had completely destroyed Canada thistle by three sprayings, with iron sulphate. Burrs have been gotten rid of by putting the land in wheat seeded with clover, mowing the stubble in August, getting a heavy growth of clover and following with corn. The burrs must be killed in August for two years in succession.—Journal of Agriculture.

The coldest night at Yuma, Arizona, was on December 10th when some of the lower sections had a temperature of sixteen degrees below freezing.

## Business Notes

### A VALUABLE EDITION.

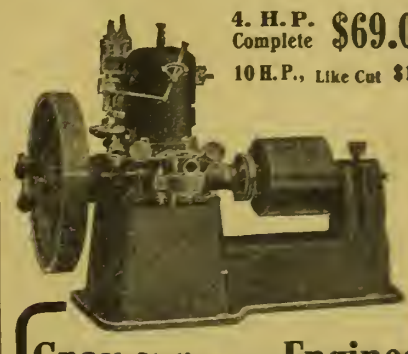
The California Fruit Grower, published at San Francisco, has for many years issued its annual during the month of December. The one for this year bearing date of December 11, is a beauty. It shows a large number of full page advertisements in two colors and one full sheet showing a full sized pineapple good enough to eat. The contents give a general view of the fruit, bean, vegetable, and, in fact, general productions of the state of California for the past year. Mr. Rowley may well be proud of his effort.

### SWIFT CALENDAR.

The Los Angeles branch of Swift & Company, the big meat packers, is distributing a beautiful calendar consisting of four parts which contain the famous old songs, "Home, Sweet Home," "Old Folks at Home," "America," and "Old Oaken Bucket," each accompanied by portrait of its author, scenes connected with his life, and a short biography. On the back of each part of the calendar are the notes for the piano of each song.

Mr. F. C. Willson of the Encinal Nurseries, Sunnyvale, is advertising in the Cultivator his specialties, Willson's Wonder, Willson's Acme, and Franquette walnuts. The Wonder was originated about eight years ago and is bred up from the French "Bijou," improving upon its good qualities and eliminating its bad ones. The tree is a strong, sturdy grower with an abnormally large nut and an exceedingly sweet, rich kernel. Mr. Willson has been testing out this nut for a number of years and so far it has stood all tests, even the blight. The variety is so excellent that we note Prof. Wickson devoted a whole page free write-up in the Press and it must be a very excellent production to call for such a notice. Of the walnuts introduced heretofore, he considers his Franquette the best of the older varieties. A letter asking for circular, prices, and information will be answered at once.

The Gray Motor Company have an ad. in this issue offering a four horsepower engine complete for $69.00. Just the thing for the ranch. This firm makes a full line of gas engines and motors. All their goods are absolutely guaranteed and the Gray Motor Company have the reputation of standing back of their guarantee. For catalog and information write the Gray Motor Company, 125 Leib St., Detroit, Mich., mentioning the Cultivator.



4. H.P. Complete $69.00
10 H.P., Like Cut $160

Gray Stationary Engines

For IRRIGATION and PUMPING, Spraying Machines, and driving churns, cream separators, washing machines, grind stones, wood saws, feed mills and all kinds of machinery on the farm and in the shop.

Full Horsepower, Perfectly Governed, Workmanship and Material Best Obtainable.

Absolutely guaranteed by a firm who have the reputation of standing back of their guarantee. Ask Dun or Bradstreet or any bank in Detroit.

Branch Agencies in San Francisco, Sacramento, San Diego and Los Angeles. For catalogue and full information about 3, 4, 6 and 10 H. P. Stationary Engines, write to the main office at Detroit.

# The Smooth Running Pomona Deep Well Pump

**RELIABILITY**

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work we know and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

**ECONOMY**

May be driven by a steam engine, gas engine or electric motor, and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbitted and will last a lifetime with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

# The Pre-Cooling of Fruit with Dry, Cold Air

## An Address on Preparing Fruit for Shipment by Geo. D. Kellogg of Newcastle before the State Fruit Growers Convention at Watsonville

REFORM and Progress have become the watchwords of the California fruit men. It is a well known fact that a slight bruise, or abrasion on any fruit will affect the keeping quality of the same. To offset this injury up to date growers will install padded picking baskets or buckets during the coming season; springless wheel sleds will be discontinued, and vehicles with springs wil be used in their place, to give ease of carriage. The frequent dumpings from the tree to the packing shed will be eliminated; and the farewell to the old dead axle wagon between the packing shed and the shipping house will be sounded. The standardized pack, with correct comprehensive markings upon the package, under the supervision of a competent corps of independent inspectors will be a reform of great consequence, bringing increased reputation and standing, as well as additional dollars for our California fruits.

All this, and still there stands before us the great problem of how to get this fruit into the eastern markets in such condition as to command the attention and admiration of the consumer. Refrigeration has been tried and under the old system has proven a help—though expensive. The crying need is for something better.

The Agricultural Department recognizing the great importance of the fruit industry, detailed their expert, G. Harold Powell, as Pomologist in charge of fruit transportation and storage investigation. This worthy official came to Newcastle in the summer of 1905 and began his investigation and experiments, and the taking of valuable notations. He improvised a cold storage car and after holding the fruit for twenty-four hours or more it was transferred to another cold car and shipped to the Atlantic coast. This experiment was conducted during the extreme heat of an extreme season and proved beneficial. These experiments were conducted from my office, with the co-operation of the fruit shippers of Newcastle. We had free access to the valuable data obtained from Mr. Powell's observation and notes. Frequent discussions led us to believe that if the fruit could be pre-cooled by the single box before placing in the car, quicker and better results would be obtained. Mechanics of inventive talent, experts in refrigeration and those having experience in handling of fruit were consulted. The situation was studied, and the conclusions reached from observation, that fruit shipped under ice with no previous preparation was inclined to arrive at destination damp, and this dampness would create a mould that would be injurious to the fruit. It was also demonstrated by the Government experts that ripening proceeds much more rapidly when a fruit is severed from the tree. so that it comes nearer the point of decay in a few hours or days than it would if left hanging on the tree in the same temperature for a much longer period; therefore the ripening must be checked as soon as possible after picking, to prevent premature decay.

The conclusions reached were these:—The successful transportation of perishable fruits in refrigeration depends primarily upon the sound condition of the fruit; upon cooling it as soon as possible after it has been picked; on shipping it in packages which cool quickly throughout; on a dry, pure, cold air, uniformly distributed in the car or compartment, and on a free circulation of such air throughout the packages, and this cooling process should not cease until the pit or center of the fruit has been as completely cooled as the surface.

With these ideas, and to reach the results sought after, a unique, and practical machine was invented which conveyed single packages of fruit through insulated compartments through which a stream of dry cold air was forced, and the fruit thoroughly cooled to the center, and to any desired temperature. This was done by the ammonia process instead of with ice. From this machine the fruit was landed in a cooled room, vestibuled with a pre-cooled car, this car was loaded, closed and shipped through to destination with the initial icing. Cars so treated will carry to any market in the United States without re-icing, and will arrive dry and in souud condition. At least that has been my experience and observation from shipments of fifty-seven cars pre-cooled by this process during the season of 1909, a season of scarcity of cars and poverty of ice. Of the fifty-seven cars thus treated there has been but one claim made for loss and damage in transit, and that was in the case of a car precooled on Saturday and left standing in the open air until the Tuesday following waiting for a car to come to be loaded into. Three days in the heat nullified the pre-cooling, I suppose. I shipped an equal number of cars during the season that were not pre-cooled, and there have been many claims for damage made. The time it has taken to reduce the temperature of these cars has been as a rule from one and a quarter to two hours. I experimented with cars in which the fruit temperature had been reduced from seventy-six degrees to from forty-four to fifty-five degrees, while the open air temperature would be ranging anywhere from seventy-five to one hundred in the shade, and fruit was received at destination without complaint. These statements may be verified from the files in the office of the California Fruit Distributors in Sacramento, through whom all my claims on loss in carloads are made.

With but two exceptions did I make known to the consignees what cars were pre-cooled, and what were not, and no attempt was made to get special reports upon the car. I took this method that I might know the facts, for my fruit is usually sent to the f. o. b. markets, and if it arrives without complaint and the draft is paid with no grumble from the consignee, it becomes prima facie evidence to the shipping fraternity that the condition of the fruit is above suspicion, and when the fruit is delivered to the auction and sold at the best price with no one to "boost" the sale we are ready to accept the theory that the fruit was all right.

COCKING HAY IN IMPERIAL VALLEY.

In one instance I advised the consignee in New York, that a certain car was pre-cooled, and asked him to note its condition. This car sold at top price and the returns came back with the notation from him that "pre-cooling was all right." On another occasion I requested consignees at Minneapolis to note conditions of a pre-cooled car and the following report was received from them: "Green fruit from Newcastle, Cal., received by us this morning. Peaches and plums were in splendid condition, being firm and dry, and did not develop sweat after unloading, although the day was quite warm. We believe that your system of cooling fruit before it is loaded into the car will place the fruit on this market in much better condition than the present plan of icing cars and loading the fruit while warm. Wishing you success in your efforts, to improve conditions in the fruit business, we are, sincerely yours, Longfellow Bros. Co."

On August 27th, one of the hottest days of the season I loaded a mixed car of peaches and grapes, pre-cooled, into a car that was cooled by being vestibuled to the cold room, with no ice. On September 7th, the car was sold in Minneapolis auction the 12th day from the picking, and this car of peaches and assorted grapes was sold for $875.00, being the average price paid for fruit in market that day. Note that this car was not cooled by ice, was not iced en route and was in condition to sell at average price. The cost of refrigeration was only the cost of the pre-cooling. The cost of hauling five and a half tons of ice was saved the transportation companies, and the expense of holding the trains, for five or six icings was all saved so far as this car was concerned; all matters of great consequence to the railroad operating departments, which if they could be applied to whole train loads would mean many hours of time saved in transit of the trains, to say nothing of great bunkers of ice, and the expense of hiring many men.

These fruit meetings are not so much for hearing theories as facts. California fruit men are facing active and intelligent competition from many states in the Union that have the advantage of hundreds and even thousands of miles of hauling over us. We have the quality, size and beauty, if our fruit is allowed to mature before picking, is properly selected and packed and displayed before the buyer, free from mould or moisture. With what is known as a postage rate of one dollar to the markets of the east, as some fruits are hauled, the California fruit grower can meet all competition.

I have demonstrated to my own satisfaction that the best results can be obtained only through the pre-cooling of the fruit, each individual package being treated and cooled alike to the center or pit before loading in the car, pre-cooled with dry pure air removing all moisture from the fruit. If so treated, I am satisfied that an initial icing is sufficient to insure good delivery.

## THE BUYING OF CITRUS TREES
### IS A SIMPLE PROBLEM IN ECONOMICS

You cannot extract sunbeams from cucumbers nor blood from stones, nor good crops of fine oranges and lemons from inferior trees. A poor tree is an expensive experiment entailing only vexation of spirit and a dwindling pocket book. Then why experiment with stock of doubtful quality? Why not get the best and be sure of the future? For 20 years we have been supplying the people who grow good citrus fruits with their trees in every citrus growing section of the world, and stand ready to serve you equally well. Why not write us and let us become better acquainted?

The economics of successful orange and lemon growing is tersely explained in our book, entitled "The Citrus Fruits; Historically, Horticulturally and Commercially," a copy of which is yours for the sum of 25 cents.

## MANURING FRUIT TREES.

By W. F. Sutherst, Ph. D., F. I. C., Bishop, Cal

FRUIT TREES, like most of our cultivated crops, are entirely artificial productions, consequently they cannot be expected to grow and flourish naturally like wild vegetation; they are often grown in a climate and soil which are entirely foreign, so that artificial aid must be applied in order that they may carry out their intended object. This is done in the operations of soil cultivation, manuring, pruning and budding. The two first will be considered in the article.

Plants take up substances out of the soil not just in the proportion as they exist there, but by a peculiar selective process, carried out by the roots, use more or less of the soil ingredients suited to the growth of the species. If this were not the case, then there would be very little occasion to apply fertilizers to the soil. When we bring a plant into a strange soil, it probably finds all the necessary mineral matter there for a while, but after a time, one ingredient which it uses up more than another, becomes exhausted and as a plant's growth is determined by the ingredients present in the smallest quantity, just as the speed of a fleet is fixed by the slowest ship, the growth gradually dwindles down to nothing. In districts where intensive cultivation is carried out, the usual method of remedying this occurrence is to add artificial fertilizers containing just the substances missing in the soil. This is by no means a rational method, except when carried out by a scientific and intelligent farmer, the wisest course being to assist nature in her methods of soil recovery.

Trees generally are the last to feel the need of manuring, as their roots penetrate deeper into the soil than cereal and other crops. The subsoil into which they penetrate is of course not so fertile as surface soil, but the quantity of mineral plant food is not so far behind that in overlying portions. The main object of these tap roots is to get water, which is naturally more abundant below the surface, but this water must contain a quantity of plant food dissolved, as it not only exerts its solvent action near the roots, but also is able to move about easily from one place to another, thus transporting mineral food from a distance to the region of the roots.

The first few inches of any soil, more particularly a cultivated one, are more fertile than any other part, this being due to the more intense action of the weather, rain falling on it and only penetrating to a short distance in most cases, bringing with it certain nitrogen salts formed in the air. It is also due to the natural and artificial manuring it receives and cultivation, as implements generally work down to a few inches. Then of more importance, the bacterial life only exists near the surface, i. e. if the conditions of sufficient aeration, moisture, food to live on, be present. A surface soil might be as fertile as possible, but if no water be present to enable a plant to draw this food supply into its system, the conditions might just as well be the reverse as regards the growth of the plant. The object then is to maintain sufficient supply of water in the surface soil and if this be attained, then the roots will soon remain there and utilize the store of food thus placed at their disposal. In a dry region, it is usual to irrigate around the trees, but frequently a very large supply of water is applied at once and the result is a washing away of plant food and destroying bacterial life, and caking the surface soil so that no air can penetrate it.

One of the best means to keep roots near the surface is to spread farmyard manure around the trees; this acts in several ways, very beneficial to the growth. First it has a great retaining power for water, holding it like a sponge, but giving it up gradually to any drier substance in contact with it, such as the underlying soil, then it has a quantity of plant food which also gradually passes into the soil, thence through the roots into the tree and finally it teems with bacteria whose work is to split up the complicated plant and animal refuse into simple substances capable of dissolving in water and being taken up by the roots. If little rain falls in the district, then surface irrigation can be carried out and the manure will absorb the water and prevent it acting in the injurious manner mentioned above. At the base of any tree trunk there are always a number of dormant "root-buds" ready to develop when favorable conditions arise, however old the tree may be, so that it is never too late to apply this method of manuring and encouraging the growth of the roots near the surface. Another method, but more laborious and not so good, is to keep the surface well cultivated by continued plowing and harrowing; this certainly prevents water evaporation and aerates the soil, but the real growing area is deeper than when manure is spread over the surface and consequently of less fertility. Of course artificial fertilizer could be applied and plowed in, adding that particular one which the crop takes out of the soil in the greatest quantity.

To sum up, however, it is, I think preferable to let the tap roots look after themselves and encourage the side roots to keep near the surface and make use of the store of food naturally existing there for their use.

* * *

It must be added to Mr. Sutherst's article that some of California's best orchardists will not agree with him in actual practice. Shallow culture and surface rooting may look good in theory, but the deep rooting forced in many of our thriftiest orchards by deep culture has given California some of its most productive orchards.—Ed.

## FUMIGATION.

From a paper read by C. E. Bowman of Tustin before the Santa Ana Farmers' Club we quote:

"The fumigation of citrus trees was introduced into Orange county about twenty years ago by Dr. Wall and Mr. A. D. Bishop. These gentlemen spent large sums of money experimenting and the present successful method is due largely to their patience in keeping up the experiments. If no other way of destroying insects had ever been used, the trees of this county would be in better condition than they are today. Many different kinds of insects infest orange and lemon trees, but the worst foes they have are the purple, black and red scale. These can be destroyed by fumigation. The best time of the year are, for black scale during January, February, July and August, the red scale can be destroyed at any time, and the purple scale, which is the worst of all, from July to February.

"If you will take notice, you will find trees which have not been fumigated, have a lot of dead brush on them. These dead branches should all be bearing fruit and would be if the trees were properly nourished. Some people say that fumigation is a fertilizer. I am not prepared to say that, but if you want clean fruit, better fruit and more fruit, fumigate your trees every year or two and you will find it will pay you to do so, because the market demands the best, and California can and should supply that demand. Many oranges are shipped as standards, whereas they would go as fancy or choice if they were clean. The time is coming when only the best fruit can be sold and the law will compel people to keep their orchards clean. I do not anticipate any compulsion, however, as American people do not need to be driven into any good thing.

"You know it does not take many boxes of oranges to pay your fumigating bills. I realize the fact that it is expensive, but help for that kind of

"As is the bird, so is its song; as is the man, so is his manner of speech."—Latin Proverb.

work costs more than common work does. We want the most reliable men we can find and that kind of men are not always looking for work, and hoping they may not find it, but of course they have to be well paid for it. Then, too, the exposure night after night is not the best thing for any man. I noticed an article in the Los Angeles Times a few months ago that made me think fumigating bills were small. The town of Newton, Mass., is spending this year $200,000 in control of the Gypsy moth. We hope this pest will not reach California.

"Two years ago our United States department of agriculture sent Messrs. R. S. Woglum and Frederick Maskew to investigate the subject of fumigation in the Southern California counties. They have instituted a new system of dosage which we used in our work during the past season. It is too soon to tell just what the results will be, but we think it satisfactory, and we hope to do better work next season. Years ago it was thought that only heavy oiled canvas was fit to use for tents, but experience has taught me that the lighter canvas is better because when the tent is dragged over sandy soil and the night is the least bit damp, the sand will cling to the canvas and often scours the fruit which is exposed on the outer edge of the tree. Experts are now experimenting on making a canvas which will give better results.

"Sometimes growers ask me whether their orchards need fumigating. You know I am a fumigator, always have been, and as I come from Missouri I will be until I am shown something better. The best argument I can use is to tell you that the growers of Tustin, who are my neighbors, and who have the best looking orchards and get the best returns from their orchards each year practice fumigation. We have a horticultural commissioner who is capable of telling you what your orchard needs. Call on him each year to inspect your orchard. and if he advises you to fumigate just take his advice and you will not regret it."

## OLIVES AS BIG AS EGGS.

Olives almost the size of Guinea eggs grown by Thos. Jacob of Visalia. The olives on six trees sold for $100 a ton on the trees. The trees are about six years old and have netted Mr. Jacob about $6 a tree; when they become ten years old they will probably fetch an income of $10 a tree and increase as the trees get older. Olives are known to grow forever almost and many are now to be found in the Holy Land, which flourished 1909 years ago.

The tree is a good bearer.

It has its off years like all other varieties of olives, but as a money-maker I can see no reason why it should not be grown largely as a side issue at any rate.

This variety is grown in California under the name of Sevillano, but this supposed Sevillano varies in size.

"Mr. Jacob seems to have the best strain of any of the Spanish Queen olives I have ever seen," said Charles A. Chambers.

"Mr. Jacob attributes the large size of his fruit to the trees having been budded on the wild Picholine variety, a very strong grower furnishing a vigorous root system that gives his trees vigor.—Fresno Herald.

Professor Whitney, of the Bureau of Soils, says that humus acts as a sponge in the soil and absorbs toxic poisons which are given off by the plant roots. However this may be the farmer must add humus to his soils to make them produce good crops. There are several ways in which humus is increased in the soil. To make the matter clear to those who do not understand what humus is it might be well to state that humus is the dark-colored mold left after organic matter or vegetable matter has decayed. Then in the light of this explanation farmers will understand that any organic matter turned under and allowed to decay will form humus. Barnyard manure, straw, stalks, etc., the plowing under of green growing crops, such as clover, cowpeas, rye or any other crop used generally for green manuring will add humus to the soil.

**Rex Lime and Sulphur Solution**

**The Famous Insecticide and Fungicide**

It has been found that Rex Lime & Sulphur Solution used in the early part of the season is as effective for Blight as the Bordeaux Mixture, and it does not have the injurious effect upon the tree as Blue-Stone. In Oregon and Washington the use of Bordeaux is being entirely eliminated and lime and sulphur solution used for all purposes. The leaves are falling from the trees, and especially the Peach, Almond and Apricot should be immediately sprayed for the first spraying. The second spraying should be done on all trees just before the buds open in the Spring.

Rex Lime & Sulphur Solution is a guaranteed article; properly prepared; free from sediment, and as cheap, if not cheaper, than the farmer can make a mixture himself.

# Deciduous Fruit Culture

## ALMOND CULTURE.

By J. W. Mills.

CLIMATE is the ruling factor in almond culture and must be first considered when planning to plant an almond orchard. An ideal situation is one where the winter months remain cold with no spring weather interspersed, and when warm spring weather does commence there should be no frosty spells. Locations where these conditions prevail with no exceptions have never been found to our knowledge, but there are locations where such conditions prevail with few exceptions. We would expect to find such a climate in a moderately high elevation and so we do, as in the branch of the Mohave Desert known as Antelope Valley. It is not unusual, but quite common for snow to cover the west end of the valley for a time in the winter, but occasionally sharp frost occurs during the blooming period.

That particular portion of Antelope Valley has become noted for its extra fine quality of almonds, but unfortunately the soil is a dry one in most places and irrigation from wells is not practicable owing to the great depth at which water is found. The total absence of fog or damp weather at the time of ripening results in an extra fine quality of nut. The absence of irrigation water spoils the combination and prevents the development of the industry. We cite this as an illustration of how the lack of one factor spoils the whole plan.

Situations where late frosts occasionally injure the crop but where moisture is abundant either naturally or artificially applied, are more desirable than situations entirely free from late frosts, but devoid of a water supply, for almonds do require a generous supply of moisture in order to set a good crop of fruit buds while maturing a crop of nuts.

It is impossible for almond trees to develop a good crop of fruit buds at the same time they are maturing a crop of nuts unless the trees receive enough moisture to force a new growth. You cannot expect your trees to be in the condition to produce a crop every year unless these conditions prevail, for all the fruit buds on the almond must grow during the summer preceeding the winter in which they bloom.

### Stock.

Almond root is the proper stock on which to bud the almond. The hard shell and bitter almond are the best. They make a strong and vigorous tree.

One year old trees are the best; select those with many branching roots. Never plant a tree without strong tap root having no side roots, for you will only have the disagreeable experience of seeing it stand dormant all summer, neither, top nor root making a growth worth anything.

Almond trees should not be planted closer together than thirty feet. Twenty-five feet will be sufficient for many years, but the almond is a long lived tree and grows to be very large, especially the hard and soft shell varieties, sending their branches out in horizontal directions. Golden State is an exceedingly strong grower and at ten years from planting will spread thirty feet in good soil. The paper shell varieties may be planted twenty-five feet as they are not so vigorous and with the exception of Drake's Seedlings, are upright growers.

### Pruning.

Almonds should be pruned like peach trees till they are about three years old or else not pruned at all after planting except to cut back some long ungainly branches. Much pruning will cause the tree to grow too thick and consequently set little fruit in the inside.

Unpruned trees will form naturally branching trees that will look rather scraggly when young, but will be well shaped when matured. If pruned when first planted, the idea to keep in view is to form a well branched head, spreading the top as much as possible. After this is accomplished, prune no more except it be to thin out the branches.

### Diseases.

Shothole fungus is bad if allowed to go unchecked. Prune rust is another bad disease and will sometimes entirely defoliate an almond grove before the nuts are matured. Red spider is the worst insect pest on the almond and will in time ruin the crops if not prevented. Lime, salt and sulphur wash will almost entirely rid the almond of all these pests if properly used. Add five pounds of blue stone to every fifty gallons of wash. The combination will be death to the two fungus diseases.

A supplementry spraying with Bordeaux mixture after the leaves are all out will head off most of the hold-over seeds of the fungus, and dusting with sulphur will keep the stragglers of red spider from increasing.

### Harvesting.

The almonds should not be gathered till at least 90 per cent of the husks split open or are dried. Sheets large enough to cover all the ground under the largest trees, should be used to place under the trees, one on each side and lapped in the center. The nuts are knocked off with poles and the sheets dragged to the next tree and so on till they are full enough to fill several boxes.

The nuts are placed on a large table within 24 hours after picking, after having been run through an almond huller. If the nuts are allowed to stand in picking boxes too long they will dry out on top and be hard to hull and will sweat and discolor the nut in the center and bottom of the boxes. At the table, the hulls and nuts are separated by hand and all stick-tights are cracked and the kernels saved.

The nuts are sprinkled and sulphured just as dried fruit is, in order to give them a nice color. The process ruins the flavor of paper shell varieties, but does not injure the soft or hard shell almonds.

## PRUNING THE VINEYARD.

GRAPE pruning is now in order, some growers being already engaged in the work. This work can be done any time after the leaves ripen or are frost bitten. Early pruning has a tendency to promote an early growth in the spring, and if the pruning is delayed until the vines bleed bady, the vines will be late in starting. This plan is sometimes followed by small growers with an idea of escaping late frosts. It very often happens that a frost that will kill the tender growth, will be missed by late pruning. While it is not practical for the vineyardist with a large acreage to delay pruning till late, a small vineyard may very well be handled that way. As a general proposition, it pays best in the long run to prune whenever it is most convenient. It quite often happens that late pruning so delays the working of a vineyard that it is impossible to get the land in proper shape.

### Principles of Long Pruning.

Some vines are pruned long because they require an extra large head of vines to offset the vigorous root growth. Others are pruned long because the bearing capacity is reduced if pruned short. The Thompson Seedless is not a rank grower on some soils but it will not bear well if pruned short. One of the chief advantages of long pruning is the opportunity given to properly train the vine. It is an old and well recognized fact that if the circulation of the sap is restricted in any way, the plant immediately proceeds to throw out fruitwood. Baronio worked from that idea when he revolutionized the pruning of the lemon in Southern California. Some varieties of grapes

that will bear only light crops when pruned long and tied straight up to a stake, will bear heavy crops when the canes are bent severely between the nodes and forced to grow in the opposite direction from which they would naturally. This principle has been explained and demonstrated by the viticulturists of the state university and those following them have been much benefited.

**Disposal of Prunings.**

The old method of hauling out the prunings and burning them in piles is now quite generally displaced by the iron sled on which the grape prunings are piled and burned, leaving the ashes to scatter over the vineyard as the sled is hauled along. It is now suggested that the best method to pursue is to cut the prunings in small pieces with a hay cutter and drop them in the vineyard. This is an effective way of adding humus to the soil without the inconvenience of growing legumes. The process is simple and conveniently executed. We had some experience in this work at the old Chino-Pomona Experiment Station. An ingenious neighbor fixed up an ordinary hay-cutter on a sled and hauled it around the country cutting up orchard prunings for fuel. It was run by hand power, one man running the cutter. Brush up to an inch in diameter was cut into inch or two inch lengths.

Such a device fixed up on a vineyard truck and operated with a small gas engine would do the work almost as fast as burning the brush on a sled. The short pieces will rot in one or two seasons and in any event will not interfere with working the land, being too short to clog in the toothed cultivators and not numerous enough to prevent the disk cultivator from entering the soil.

No doubt this method would partly solve the sand drifting problem in the vineyards in the Cucamonga and Wineville districts. In some of the grape growing districts of the old world where drifting sand covers the vines, straw is spread over the ground and pressed part way into the sand by running disks over it set to run straight. This makes the ends of the straw to stand up straight like grass and thereby catch the sand and prevent drifting.

On heavy soils this method of disposal would improve the physical soil condition as much as it would that of the light soils.

No doubt this method of disposal of grape prunings will not become popular for the reason that it requires special machinery in part of the equipment. In order to handle the prunings rapidly, there should be a force feed that will put the vines through, no matter how hadly arranged or. bulky they may be.

### REPORT OF COUNTRY LIFE COMMISSION.

Arrangements have been completed by the Spokane chamber of commerce to print for free distribution the report of the Country Life Commission, appointed by President Roosevelt in 1908 to make a tour of the farming states for the purpose of investigating conditions and calling the farmer's attention to the opportunities for modern business methods and better living on the farm. The request to publish the findings of the commission and the president's special message transmitting the report came from a meeting of 500 men and women, representing various districts in the western and Pacific states, gathered in Spokane to discuss country life problems and rural school betterment under the joint chairmanship of David Brown and Edwin A. Smith.

The commission's report was read in the United States senate on February 9 and ordered to lie on the table, as the result of the opposition by Senator Tillman, who objected to its publication as a public document for the reason that the commission was appointed by President Roosevelt without authority from Congress; that it is not provided for by law, and that it has no legal function. Senator Dolliver spoke at length in its favor.

### THE EL CAJON VALLEY.

I notice in your issue of the 2nd inst. a communication from one W. W., El Cajon, in which the statement is made: "It gets very hot in summer, temperature standing from 100 to 120 degrees in the shade." The inference is of course that the regular temperature of El Cajon Valley runs between 100 to 120 degrees during the summer. Now I don't know who W. W. is and don't particularly care, other than to believe that he is a wonder with a mammoth imagination, bent on giving the finest and best climatic valley in the state of California a very black eye, to those unacquainted with its climate.

We have a record of temperature and rainfall of this valley for every day during the past ten years, and in no case in that time has the temperature ever exceeded 110 degrees. Five days only in 1908 reached 100 degrees, towit, July 7, 8 and 9, 100, 105 and 103 degrees respectively; Sept. 10, 100 degrees; Sept. 12, 102 degrees. In 1909 six days reached 100, as follows: May 31, 106 degrees; June 1, 100 degrees; Aug. 21, 107 degrees; Sept. 14, 15 and 16, 101, 105 and 103 degrees. So during the last two years the highest temperature recorded by the government maximum thermometer was 107 degrees, and that only for one day.

I don't understand why W. W. should go to Los Angeles for information about walnut growing. If he had made proper inquiries he could have been satisfactorily answered by residents of the valley. I have some walnut trees on one of my ranches which yield fine nuts every year, and that without irrigation.

I write this in justice to El Cajon Valley, where you have a large subscription list, and in the interests of truth.—Phil J. Kessler.

### PRIZE WINNERS.

H. B. Tronson of Eagle Point, Ore., where he and his partner, E. F. Guthrie, have been orcharding about three years, becomes the quality apple king of America by winning the sweepstake of $1,000 with a car of Spitzenburgs at the second National apple show in Spokane, November 15 to 20. His exhibit of 630 boxes, selected from a yield of 2,800 boxes in a five-acre orchard of 17 years' old trees, also won the first prize of $250 in its class. W. W. Sawyer of Sunnyside, Wash., was second in the sweepstake, winning $500, and took the first prize of $250, for any standard commercial variety, not named, with a car of Grimes' Golden apples. The awards were made by a board of five judges, headed by Professor H. E. Van Deman of Washington, D. C. His associates were George J. Kellogg of Lake Mills, Wis., W. J. Green of Wooster, Ohio, A. P. Bateham of Mosier, Ore., and H. M. Dunlap of Savoy, Ill.

"Did you have a pleasant time at the picnic, Ronald? I trust that you remembered to Fletcherize and masticate each mouthful one hundred times." "Yes ma'am I did an' while I was chewin' my first bite the other boys et up all the grub."—Denver Field and Farm.

At Portland Union Stockyards a fancy steer commanded $25 per hundred, or a total of $325. This is $7.00 per hundred higher than the highest price at the International Stock Show at Chicago. This was for a California animal.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## HOLIDAY TIMES.

Mrs. M. E. Sherman.

THE world's thoughts during Christmas time turn to love, to love expressed to members of the home circle in gifts. If love could be weighed in material scales Uncle Sam's mail would indeed be weighty during this time. Love in the highest sense is the only thing worth while and only as we love God and our fellow beings do we reach any success worth while in life. Then do not sigh and think that the flurry at Christmas times is not worth while. It is worth while to bring back the slowly hardening heart to the happiness of childhood's bright Christmas hours. I wonder if any one in California has ever tried the plan of adding one more gift to their list? A gift for the home! I know a family that now gathers together four generations, that has for fifty-one years followed this custom. This home is rich in choice rugs, paintings and even sculpture. It has also, rare old china and silver, gathered bit by bit. The library contains interesting as well as rare boks. Contempoary magazines are given for a year by even the school children. There is only one limit put on the gifts—that is they must express the thing the giver feels needful that is within his means to give.

### The Farm.

What Christmas joy can be given to our lesser brothers, the dumb animals? Not much to be sure, but we can see that they have cleanness, shelter and abundant water and food. Hanging green garlands and gay bunting in a stable, as I have read of some enthusiasts doing, would bore the cows considerably. It is amusing to see that conventionality—or the accustomed—seems to be the only idea of Madame the cow. Changes disturb her greatly. I read the other day that in a certain section of the country the dairymen followed the practice of having the milkers take the cows in rotation so that in the three strings each man shifted up one string at each milking time. In Scotland I saw them doing the same thing, but there they said it was to prevent the poorer milkers from always milking the same cows. An appropriate present to the cows for Christmas is a ton of oil meal to be given in half pounds twice a day until the storms have passed away.

### Petting.

When the cold rains begin, the outside cattle and horses need looking after every day. A few small corrals with a warm little stable where any that are thin and weak can have extra feed and shelter should be provided. The old law of survival of the fittest will keep the species alive but wipe out the improved qualities in the struggle for existence. We see this in the human family as well as in animals. When it is a matter of working to keep alive instead of having a margin of strength to improve the mind people degenerate very fast. The constant call for draft horse stock should stimulate the farmer to better efforts to fill the demand. The ordinary ranch fails, with the best of ancestry, to hold the size of the drafters up to 1800 or 2000, because the weanlings and yearlings are allowed to lack for abundant food and protection. I can take two pure bred Percheron colts from mares weighing 2000 pounds, turn one out to pasture after weaning and put the other into winter quarters, that is, in a small corral with other weanlings, and feed them hay with the silage the cows leave in the mangers. This with a snug shed closed on three sides for shelter will increase the size markedly. At two years old they will be as large as the others are at four. The others turned out to gather their food will rarely reach more than 1600 pounds at maturity, while the sheltered colts will come up to the full weight of their dams. The sheltered colts can do considerably more at three years old and are ready for a heavy day's pulling at four. The lesser ones are not ready to go to work much before they are four. Quick and continuous growth should be considered as most valuable in live stock. A check is rarely taken up again in their growth. I had one thorough-bred mare, whose yearling took a bad case of distemper and for a year never grew at all, then by care started to grow, but was six years old before she weighed 1150 pounds. Her full sister a year younger, at two and a half weighed 1120 pounds, was so much larger that it was not possible to use them together until the older one was six years old. Then they matched so perfectly that no one but Pat and I could tell them apart when turned out in the corral. The foreman was sometimes called to hitch them up in the family surrey and was never sure he had them right until he started them off and if they crowded each other against the pole he would change them around.

### Brood Mares.

When the mare and her colt are turned out in the rainy season to pasture, it is well to see that the food of the mare is producing enough milk for the colt. If she is dropping down in milk, bring her up, and if the colt is old enough wean it and put in the pen with the old weanlings. The mare can then go to work, but before starting her in, if she is at all thin, give her a few feeds of bran, gradually adding rolled barley to it.

### Mash.

Can you make a bran mash? Like coffee, mashed potatoes and a few of the every day things, the average furnished is not of good quality. To make a bran mash take a clean bucket, well scalded out, and put in the measure of bran. Then pour into the center, stirring all the time, scalding water enough to make it moist. Cover it closely while hot with a blanket and let it stand three or four hours until cold. There are many times when a cow or horse is sick and weak and needs a bran mash. The usual proceeding is to use any old bucket and some hot water. A handful of bran is stirred into a slop and scalding hot it is put under the sick animal's nose only to be rejected. It should be cool or cold and only moist enough to hold together when pressed in the hand. Then add a little salt and it is relished by the sufferer.

### Thinness.

The heifers that do not put on fat readily make the best milk cows, but they also will suffer the most from cold and wet. Go over the young stock day by day, picking out those that are losing weight and care for them carefully. Do not overlook the dry cows in this work. Many cows die in the springtime when they calve from the debility caused by lack of winter care. Now if there is silage in abundance it will take the place of grass and save the buying of expensive bran.

### Friends.

The little colts and calves raised together in the corrals seems to have an affection for each other that lasts. We had last summer a five months old heifer that became troublesome by a trick of crawling under the fence along the canal. In summer time it is almost impossible to put a post into the ground on the heavy

land of the ranch. This heifer was turned out with the string of youngsters down in the field. She remained always alone and it was necessary in the daily counting to hunt her out of the bushes. I do not believe she will ever make as good a herd cow, as she has now the selfish habits of an only child, and lacks the community training needful for good citizenship. The young stock is usually sent out in bunches. At present there are five heifers that have remained friends for two years. The horses are the same way and the colts that are raised from weanlings in a pen together often hold that friendship for life.—M. E. Sherman.

## WHEN TO BUY A GOAT.

By Miss B. A. R.. Stocker, San Luis Obispo.

WHERE a thing can be had at any time, by anyone ready to pay for it, the old maxim, 'Don't buy a thing till you want it,' probably holds good; but in the goat market it is different. We have got to look ahead. Chances are to be taken when they come; and this is not every day. When we start out to provide ourselves with a goat, our idea is probably to enjoy the milk immediately. But a little reflection may give us patience to take the better way. People frequently write for a doe 'just fresh.' Consider that a goat who when fresh is perhaps giving her own weight in milk every twelve days, must be carefully fed and handled, kept serene and comfortable, and milked regularly three times a day. And now would you ask to have her shipped to you perhaps several hundred miles—twenty-four hours, thirty-six hours of pain and fear and misery? Isn't it cruel? Isn't it enough to ruin her?

Another thing; goats, more perhaps than any other animal, have an exclusive affection for their keeper, and sometimes fight desperately even at home against being milked by any one else. I knew a goat that actually went dry rather than be milked by the men folk of the family when the woman she loved was sick in bed.

Now suppose you have bought your goat, "just fresh"; and when she comes to your strange place in all that feverish pain and misery of her long journey, she is further afraid of you and won't let down her milk With patience and kindness she will be reconciled to you in a few days, though she may cry and pine for her old friends for a couple of weeks. But the mischief is done.

To require a goat to be shipped when near her time to bring kids is not much better. They are apt to be badly jolted on the cars and subjected to roughness which may even prove fatal a few weeks later. It is much better to purchase a doe who is bred, but not far along—say, two or three months, and not in heavy flow of milk, if to be shipped any distance; or a young doe bred for t he first time. Then she has plenty of time to get used to you and her future home before the serious business begins; and all is likely to be well.

In Switzerland when an addition to the family is contemplated, plans are laid for one of the goats to be ready for the duties of a foster mother.

It is too late to start out to hunt for a goat when the baby is crying for the milk, especially in a country where goats are as scarce as they are in California at present. Some peope have naturally such a good way with animals that even a strange goat will adopt them at once, especially if they have had a goat before.

As good a way as any, if we have time, is to buy a couple of weaned kids and raise them. Goats are sociable creatures and do much better where there are several. In this case the outlay is small and the task fascinating.

---

The farmers institute held at Beaumont last week called out a good attendance, and a most valuable program was given.

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

## CORN SUPPLEMENTS AND SUBSTITUTES.

The proper supplementary feeds which balance corn in a ration not only enable the hog to show better results in fattening, but they also make possible a more economical ration. Feeding a hog on corn alone, whatever the form, is a false economy by which the feeder cheats both himself and the hog. Its natural supplements are those which furnish protein and mineral matter, and, if not easily available on the farm are usually purchasable so as to be used at a profit. Some, such as clover, alfalfa and other pasturage, are unquestioned as to their desirable qualities and others, such as the prepared meat scraps from the great packing houses and known by their trade names of meat meal or tankage, have rapidly come in favor for the large amount of protein they supply. The ash or mineral matter of the corn grain is considered indigestible for swine, and the absence of mineral matter impairs the nutritive process and injures the structure; yet it is neither difficult nor expensive to supply hogs with ashes, salt, coal, charcoal or charred cobs as correctives, with corn.—From Coburn's "Swine in America."

## NOTED HORSE DEAD.

"Directum, 2:05¼, champion trotting stallion for seven years and one of the greatest harness horses, is dead at the International Stock farm, Savage, Minn. In some unknown manner the horse sustained a slight scratch over the groin and blood poison set in and after two days the famous animal died.

Directum was purchased by Mr. Savage in 1901 at the Old Glory horse sale in New York for $12,000 and two hours afterward he was offered $25,000 for the stallion by a rival bidder who was being represented at the sale by an agent. He was bought from William E. Spier, a New England breeder. At four years of age Directum set a mark of 2:05¼ in a race, getting three records by the performance. It was the fastest mile ever trotted by a 4-year-old stallion, the fastest heat by a 4-year-old in a race and the fastest third heat ever trotted.

# Small Fruits and Vegetables

## STRAWBERRY CULTURE.

THE small fruits, comprising the strawberry, raspberry, blackberry, currant and gooseberry, play a very important part in the economy of the household, in-as-much as they come at a time when there is a scarcity of other fruits and oftentimes of vegetables as well. So it is very important that every farmer, especially, should set apart a plat of ground sufficiently large to be capable of producing all the small fruits that the family can possibly consume during the year. The size of the plat will depend somewhat upon the size of the family.

There is probably no fruit grown that will adapt itself to such a diversity of soils and conditions as the strawberry. For that reason it can be grown by practically every one, in nearly every portion of the United States, who has a few square rods of good soil which can be devoted to that purpose.

### The Soil.

The soil for strawberries should be a deep rich loam, capable of holding much moisture. Whether it be clay or sand, it should be made deep and rich by the application of a heavy dressing of manure, well rotted if possible, and plowed under to a depth of eight or ten inches.

If the soil is a heavy clay with a hard tenacious subsoil, nothing will give better returns for the money invested than to go over the entire plat with a sub-soil plow, following the breaking plow, thus loosening up the subsoil to a depth of fifteen inches. This plow will furnish a reservoir for the surplus water in the spring which may be drawn on by the plants during a time of drouth which often comes when the fruit is beginning to ripen and just when an abundance of water is absolutely necessary in order to enable the fruit to develop properly and the plant to attain a good vigorous growth. If the subsoil is of a sandy or gravelly nature, the subsoiling will not be necessary; in fact, on such land the crop is often cut short because of the looseness of the subsoil which allows the surplus water to pass down out of reach of the plant roots.

### Always Set New Plants.

This is one of the most important points to keep in mind. No plant should be transplanted that is more than one year old. A plant that has borne fruit should never be used in a new bed. Select plants of the previous year's growth for transplanting, if set in the spring. Such plants may be told by the bright yellow color of the roots.

### Pistillate and Staminate Varieties.

It must also be borne in mind, that some of our varieties have perfect blossoms and some of them imperfect. In other words some are capable of fertilizing their own pistils while others must depend upon other varieties for their pollen. In almost all small fruit catalogues, the perfect and imperfect varieties are designated by an S or a P, indicating that the variety is staminate or perfect, or pistillate or imperfect. In planting, some of both kinds should be used so as to insure a good stand of fruit.

### Distance to Plant.

For general culture, the rows should be three and one-half feet apart and the plants set eighteen inches apart in the row. That will give plenty of room for a horse and cultivator, and the rows should always be perfectly straight and long enough to allow of horse cultivation. This will save much time and labor in keeping them free from weeds.

### Hill vs. Matted Row.

Some will prefer one method and some the other. The matted row system will appeal to the busy man or the lazy man, as less labor is required in keeping the plants thinned. In hill culture the plants are not allowed to run at will, but are kept in hills of four or five plants each, all other runners are cut off and treated as weeds. If large fine berries are wanted the hill or half matted row system is preferred; but if a large quantity of medium sized berries will answer the purpose, and for family use they are just as good, then the matted row system may be used.

---

## ONION CROP BRINGS $1500 PER ACRE.

At the real estate office of Cannon & Pitzer, in Roseburg, may be seen some very fine samples of onions grown by Joe Snider, of Day's Creek. From a piece of ground measuring 55 square rods (approximately one-third of an acre) he harvested this year a little over 500 bushels of onions. These were sold at 2 cents per pound, bringing him upwards of $500, or a return of over $1500 per acre. This beats any fruit crop heard of except the immense yield of apples grown by J. B. Smith at Winstons last year. It also further demonstrates the great value of Douglas country soil and climate, and also again demonstrate that what Douglas county needs is more producers. The natural conditions are there, if given proper attention.—Portland Oregonian.

### SOIL FOR POTTED PLANTS.

An expert florist gives the following instructions:

He gets a quantity of sod and piles them up in a heap, and there they remain until well rotted. This pile is then turned over and beaten up. As it is turned over every layer of the sod is followed by a layer of well-rotted stable manure, each layer of manure being about one-quarter as thick as the layer of sod. This is then allowed to remain until wanted for use. Then one commences at one end of the pile and chops down the face and beats the whole up well, breaking all clods and mixing thoroughly together.

It should be taken and broken up still further. It is now mixed with one-fifth or one-sixth of sand. This sand can be bar sand from the rivers or good road sand from the gutters. The whole is then sifted through a common wire sieve. It is now ready for potting purposes. The sand is mixed with the soil to keep it from baking hard. It is an easy matter for any one to always have suitable soil for potting plants if they will do as the florist does.

This matter of suitable soil is so easily overcome by just a little timely effort that we wonder why it is that so many go on in the same rut year after year, with the poor plants struggling for existence in soil baked as hard, many times, almost as the pot itself.

The idea with many that, especially when in a hurry, anything will do to pot flowers in (it makes no difference) is about on a par with the farmer or gardener who plants in a certain place because of convenience, without regard to the character of the soil, and then grumbles because he has no crops. Flowers have life and must be properly fed with just as much care and intelligence as you give to your horses, cats or dogs or any other living thing.

### ATAMASCO LILIES.

There are two varieties of this popular flower grown on this coast—the one pink, the other white. The common names applied to them are zephyr lilies. The proper name of the white variety is Zephyranthes candida. It begins to bloom about September 1st and continues for three months. It is a native of Brazil and grows along the marshy banks of the La Plata river. We know of no plant that increases so rapidly, and we think it within the bounds of truth to say that tons of the bulbs are thrown out annually in this state.

The pink variety is popularly known as Atamasco lily—properly it is Zephyranthes carinata. It is a native of Cuba, Mexico and Central America. It is both exquisitely beautiful and fragrant. The flowers are borne on scapes 6 to 12 inches high, but one flower to a scape. As a border plant it has few equals and no superiors. It responds to good culture, the flowers being larger and the stems longer. It is fine for cutting.—Pacific Garden.

### THE COLEUS.

The coleus is such an easily grown subject and so showy that it is no wonder it is so popular. The number of varieties is practically limitless, and if one is at all interested in seeing new forms the expenditure of a few cents in a package of seed is all that is necessary. Though many of the resulting varieties will probably be worthless, there is always a chance of getting some really good ones, and in any case it is very interesting to watch the young seedlings as they develop, first the almost colorless leaves and later the larger, showy ones that show the character of the variety.

Beyond the interest accruing from their culture it is not necessary to grow these plants from seeds, as cuttings are easily procured in quantity in spring by wintering a few plants of each variety.—Gardening.

INDEX, 678, 679.

## Happy New Year.

THE PRESENT is a time when nearly everyone is taking account of stock in hand, making resolutions for the coming year, and mapping out some plan of action. It is also a season of kind wishes from friend to friend, and the Cultivator takes the occasion to wish for everyone of its patrons a most successful and happy year.

As a rule, this promises to be a good year for producers in California. In some lines there are discouragements, but these may be overcome by the resolution and intelligence of the class of people who are tilling the soil in this state. The recent State Fruit Growers' Convention held at Watsonville showed that the fruit growers appreciate the necessity of studying conditions which confront them and of bettering them, and, as we have said, we believe they have the intelligence and strength of purpose to accomplish this. If this is done, another New Year's day will find us far advanced toward prosperity and standing where the state has stood for many years—in the forefront of the fruit producing states of the Union. For stockmen there was never a brighter outlook. Certainly they cannot complain about prices. With them the one thing necessary seems to be to produce enough to satisfy the market. Celery, cabbage, asparagus and other growers all have their problems, but with all the prospects are most encouraging.

Then all together let us work for still greater advancement and greater happiness for ourselves and our neighbors.

## Wholesome Reading.

WE HAVE before us an excellent little leaflet entitled, "Current Reading." It is issued by the publishers of the Youths Companion. We note in it some invaluable advice, just a bit of which the Cultivator will pass on.

"We must be sure that the periodical we invite to our homes is honestly edited for us. If there are young people the reading of the home must be watched with double care. Boys and girls enjoy the same kind of reading as their parents." "In the family no book or periodical should be allowed which does not help to build mind and character and is not an inspiration to high ideals. It is a parental and a public duty to see that young folks are wisely guided in their reading." "Even the boy of the best up-bringing may be powerfully attracted by sensational stories of impossible adventure, by details of crime and criminals, also by cheap and vulgar comicalities. The girl may be fascinated by the silly, false and offensive sentimentality of a certain mushy kind of cheap love story." "At its worst cheap reading destroys their minds and morals."

No greater duty is before the parent than that of providing attractive, wholesome, cleanly reading matter for the young in the home, and in this it is most easy for the mature mind to make the mistake of thinking that our young people can at once take up with the class of reading matter which may please us, or leave it alone. We must recognize the fact that they demand, or at least will be benefited more by, an attractive class of literature than if they are forced to read that which is too dry or beyond their years. But, as is pointed out in the above quotations, let us not go to the other extreme and give them the cheap, trashy stuff which is flooding the book stalls and even many newspapers today. In addition, we believe the colored supplements of many of the newspapers are directly demoralizing and should be kept from the home.

## Specialize.

THE DAY OF THE "OLD SETTIN' HEN" in the barrel in the backyard may not be past, but the immense poultry plants of today promise larger things for the industry than the small backyard efforts.

Petaluma has many plants where thousands of hens are colonized; dairy ranches have been transformed into poultry ranches and feed is bought by carloads. On these ranches no brooding hens or incubators are used, and no attention is given to hatching. The chicks are delivered to the ranches by hatcheries which make that their entire business. Even the hatching and brooding are now often separate branches of the industry; the youngsters are sometimes delivered to the ranches a third or half grown. This condition has been brought about by a system of specializing. Men with capital have installed large incubators and devote their whole attention to hatching; others have established brooders, taking the youngsters at one day old and later delivering to the ranches.

This is not only true of Petaluma but to a certain extent of Southern California. The industry is attracting men of capital who have the ability necessary to handle big undertakings. One plant near Los Angeles devoted exclusively to the production of fryers and broilers has been established at a reported cost of one hundred thousand dollars. It is expected that good interest and a profit will be made on that investment.

The barnyard fowl may not disappear entirely but surely brainy people are being attracted to the industry who will make it more of a business proposition than it has been in the past.

## Agriculture in High Schools.

THE COLLEGE OF AGRICULTURE of the University of California has just issued Circular Number 47, touching upon agriculture in high schools. It is written by Prof. Leroy Anderson and in answer to the deep interest manifested in many sections of the state in regard to the teaching of agriculture in our high schools. The writer refers to the work already taken up along this line in the Oxnard Union high school, the Imperial county Union, the Kern county Hanford Union High School, the Siskiyou county Union High School at Yreka, the Vacaville High School, and the high schools at Hollywood, Glendale, Ventura, Santa Cruz and Gardena. The latter mentioned is within the city limits of Los Angeles and is making quite a record in its work. The book closes with an outline for high school agriculture which should be valuable to all who wish further knowledge regarding the coming education.

## Buy Retail—Sell Wholesale.

A POULTRYMAN recently remarked in the office of the Cultivator that the great drawback with poultrymen has been the fact that most of them have bought all their feed and poultry supplies in small quantities at retail price and then turned around and sold all their products at wholesale or even less to the jobbers who pay the very lowest price. Any dealer in merchandise who would conduct his business along these lines would necessarily require a long purse to make both ends meet. In fact, it would be impossible. That the poultryman can exist and follow this policy shows that there must be big profit in the industry.

It seems to us that it would be wise for the poultryman to reverse this method. If he is so restricted financially that he cannot buy in carload or ton lots, let him combine with a neighbor, or several neighbors, and buy at the very lowest possible price of the highest possible quality, and then with the same enterprise so handle the selling of the product of his yards as to secure better prices. When this is done there will be a great change for the better in the finances of poultry people.

## Real Beauty Spots.

CALIFORNIA is able to show many beautiful home places, and many are on the farms or orchards of the state. As a rule, we believe the orchards have more beautiful surroundings than the grain or dairy farms. We say, as a rule, for many of the dairy farms are real beauty spots. The houses are attractive, there are well kept lawns and shade trees which give a delightful setting to the place. But as many of these as there are in California, the proportion should be much greater, greater not because of sentimental reasons, but from a purely financial standpoint. Farm property becomes more attractive to newcomers, and the more the better class of people are attracted to the farms, the more desirable become the surroundings. Some farmers are so situated financially that they cannot give much time to beautifying their places, but there are others, well to do, who build immense, expensive houses which have no suggestion of attractiveness and the owner seems to have no idea of tasteful arrangement or of beautifying with shrubbery or trees.

Beautify the home. Make it a homestead, too attractive to leave.

## A Representative Paper.

ONE OF THE UP-TO-DATE PAPERS which come to our desk representing the great producing interests, is the Weekly Oregonian published in Portland. While it is a newspaper, it gives particular attention to the farm interests of that state. The issue of December 16th contains a most compete review of an address made at the Annual Meeting of the Oregon Dairy Association, also of addresses made at the meeting of the State Horticultural Society held in Portland on December 6th and 8th. The extended quotations from these addresses, together with other farm news are most creditable.

## Carnegie Fund Discontinued.

THE trustees of the Carnegie Institute have withdrawn the support which has been extended for the past few years to the Luther Burbank experiments at Santa Rosa. The commercialism which is alleged has been a feature of the experiments is given as the cause of the withdrawal of the Institute's support.

This will cause regret on the part of those who hoped for good to the fruit industry from these experiments. But it must be admitted the Institute had good cause for its action.

# Agricultural News Notes of the Pacific Coast

## Northern California

Oroville people are using olive pulp or pomace for fuel.

The honey crop at Gazelle, Siskiyou county, has been large during the past season.

The favorable season is inducing the plowing of much land for seeding to winter grain.

Napa county is contemplating voting bonds for building a system of permanent roads.

Yuba City farmers report the turkey market as good, and a big supply of birds on hand.

Sutter county peach growers report the setting of buds to promise a good crop of peaches next year.

Many Sutter county peach growers have contracted their 1910 crop of Tuscan Clings at $30 per ton.

It is planned to rebuild the alfalfa mill which was burned near Proberta, Tehama county, last summer.

The last car of prunes was sold last week at Healdsburg, Sonoma county. This is the earliest clean-up of any season.

Mendocino county apple growers have found good profits and much encouragement from fruit shipped to San Francisco this year.

The last of the beet shipments from Yolo county to the Sacramento Sugar Company at Hamilton City was made on Dec. 19. It went by special train.

A Greek has agreed to establish a cheese factory at Woodland for the making of cheese from the milk of ewes if he can secure the milk from 1000 to 1500 ewes.

The committee appointed by State Commissioner Jeffrey to devise plans for the formation of the Fruit Growers League, will meet on December 30th to discuss plans.

High school students at Williams, Colusa county, devote their noon and recess hours to the study and practice of plant growing rather than to ball and other games.

Articles of incorporation of the Feather River Dredging and Concentration Company have been filed in Sutter county. It is reported that the work will be done below Yuba City.

There are 10,769 public school teachers in California and there are 1490 high school teachers. There are less than ten per cent of the school children of California in the high schools.

The Vacaville fruit growers association organized last year, held its first annual meeting recently and elected P. H. Buckingham President and C. J. Uhl Secretary. The past season's business has proved eminently satisfactory to members of the association.

The District Court of Appeals of the Third District has reversed Judge Head of the Shasta County Superior Court in his decision in the suit of the Northern Light and Power Company against twenty-eight farmers living on Cow creek. Judge Head decided nearly a year ago that the farmers' riparian rights could not be condemned for such a public service corporation as an electrical power company.--

## Central California

Congressmen are distributing packages of free seeds.

Porterville has shipped 575 cars of oranges since November 1st.

The recent storms have swollen the San Joaquin and other rivers of the Valley.

Porterville is maintaining an exhibit of oranges at the Exposition in Omaha.

Lindsay reports the navel crop this year from five to ten per cent greater than last year.

Stock breeders at Delano are planning to import a car of red polled cattle from South Dakota.

One Kerman dairyman has recently purchased in Los Angeles county a carload of registered Jerseys.

With the price of hogs soaring, farmers of the Valley are discussing more extensive swine raising.

The work of building the new creamery at Delano is well under way and its early completion is promised.

The chamber of commerce at Porterville has an exhibit of insect pests in a case presented by the State insectary.

Farmers institutes recently held through the San Joaquin Valley gave much attention to the discussion of good roads.

The Tulare county chamber of commerce is maintaining a fine exhibit of products in the chamber of commerce, Los Angeles.

Tulare county orange growers have netted in the neighborhood of $1.35 per box and are well pleased with the season's returns.

The board of supervisors of Tulare county has been asked to appoint a veterinarian to inspect livestock in the Porterville section.

Still greater tonnage has been signed in the raisin pool, and it is now assured it will be a great advantage in saving the raisin market.

Candidates for horticultural commissioner in Santa Cruz county are brushing up for an examination which is expected to be held at an early date.

The board of education of Fresno is considering the advisability of establishing an agricultural course with a practical experiment station at Kearney Park which belongs to the state university.

The Porterville chamber of commerce has an exhibit of a cluster of oranges, one branch having ten oranges weighing exactly ten pounds and all perfect in shape.

It is claimed that the meat trust is endeavoring to drive independent slaughter houses out of business and force growers to sell only to the trust by making impossible conditions for the slaughter houses near San Francisco.

The farmers union which marketed much of the fruit for melon growers at Turlock is being roasted by growers because of poor returns. The advice generally given to the farmers is to stick to the union and try to bring about a reform in its management.

## Southern California

Packing houses in many orange growing sections are opening.

Grain growers near Cucamonga, San Bernardino county hope for a big crop of grain.

A man at West Orange reports his 1909 walnut crop as exceeding one ton to the acre.

Fullerton has made heavy shipments of sweet potatoes during the last few weeks.

Oranges in many Southern California orchards will run exceedingly large this year.

Orange county orange growers received good returns for the few cars of holiday fruit sent out.

Santa Barbara candidates for horticultural commissioner are brushing up for an early examination.

Brawley is happy in the installation of its up-to-date creamery, said to be one of the most completely equipped in the state.

A walnut grower near Anaheim is grafting the wild walnut trees in the hills over to the edible nuts and is having good results.

Whittier apple growers have found good results in the production of apples there, and it is thought further planting will be encouraged.

The desert section near Needles, San Bernardino county, was surprised by quite a heavy fall of snow at the time of last week's storm.

Rangers in charge of the forest reserves are planning for more extensive planting of pines in the mountains this spring than ever before.

Orange county farmers will produce more of winter melons and casabas this season owing to profits secured by those who have grown them the past year.

W. C. Mendenhall of the U. S. Geological Survey reports that the San Jacinto and Moreno Valleys are capable of developing thousands of inches of water for irrigation.

Special orange trains are being made up from Southern California shipping points, and the next six months will see lively times in all orange producing sections.

The Union Sugar Co. at Betteravia closed its season last week. The beets showed the biggest content of sugar this year of any season since the establishment for the factory.

A little injury was done by "northers" which visited some of the orange growing sections after the recent rains, but the reports are that it is lighter than usual and no great harm done.

The celery growers are unable to fill all the orders sent in for well bleached celery, owing to banks thrown up against the celery having been washed down by the recent storms.

The Whittier Vegetable Growers Association reports the last season as an especially successful one, especially in regard to tomato shipments. The association shipped over 560 tons ranging from twenty to forty-five dollars per ton.

## The Coast

The Idaho State Dairy Association meets at Caldwell January 9-11.

Seattle is quoting potatoes at twenty dollars per ton for best stock.

The Idaho Pure Seed Convention is to be held in Caldwell January 13 and 14.

Reno, Nevada, reports many apples frozen on trees before they could be picked.

Export wheat is advancing at Tacoma and now stands at $1.14 for bluestem.

Eight inches of snow is now lying in the apple orchards of the Hood River country.

One apiarist at Vancouver, Washington, cleared $1,080 on his honey output last year.

Christmas turkey prices at Portland were higher than turkeys have reached for some years.

The Washington State Livestock Association will hold its annual at Spokane January 4 and 5.

A North Yakima, Washington, poultryman has a bantam rooster which he asserts is 22 years old.

A farmers institute held at Sandpoint, Idaho, gave the entire session to the discussion of rural schools in rural communities.

A large rancher near Moscow, Idaho, has sent an expert to Europe to buy a cargo of Shropshire sheep and Guernsey cattle.

The opening of the lands for allotment and settlement in the Yuma Indian Reservation has been indefinitely postponed.

Business men of Walla Walla, Washington, have formed a large company for the handling of products of the Walla Walla Valey.

Some of the most noted horticulturists in the nation are expected to speak at the State Horticultural Meeting to be held at Nampa, Idaho, January 5-7.

A large wheat raiser at Dayton, Washington, has just closed a deal for $50,000 worth of bluestem wheat for which he received $1.10 per bushel.

Hawaiian stock men have found the algaroba bean, or the 'St. John's Bread," when cracked in a recently perfected machine, to make excellent stock food.

The membership of the grange Patrons of Husbandry of Washington now totals 14,000. This state leads all states in the Union in the percentage of increase of this order.

The Western Washington Experiment Station at Puyallup is investigating the crown gall of blackberries which is very troublesome to the blackberry growers of that state.

The 46th Annual Convention of the National Wool Growers Association will be held at Ogden City, Utah, January 6, 7, and 8. Tariff and Warehousing will be features discussed.

Poultry Shows are to be held in Washington as follows: Bellingham December 28-January 1; Tacoma, Jan. 4-9; Spokane, Jan. 11-15; Seattle Jan. 17-22; Walla Walla Jan. 17-22.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90. 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

$2.60 FREE. If you will send us the addresses of ten persons who have any fowls, we will send you, post-paid, our Biddy Booklet and an article worth ten cents, which many say no household should be without. If you will send us twenty-five addresses, we will also send you The Poultry Manual, profusely illustrated, by those high authorities, F. L. Sewell and Ida E. Tilson, a reliable work worth fifty cents, but free to you. For 100 addresses we will also send free, and expressage prepaid, another most useful article which sells in the East at $2. We merely want to send to them, by mail, some advertising matter, but your name will not be mentioned in connection with it in any way.

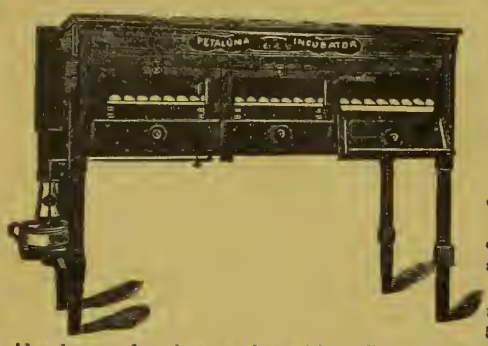
## Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### THE BREEDING OF TURKEYS FOR PROFIT.

THE market for turkeys has been so great during the last few years that prices have constantly shown a tendency to rise and there is no doubt that this tendency will continue.

For selling in the poultry market for food, turkeys are more profitable than any other class of our domestic poultry. They always bring higher prices than other kinds of poultry and pound for pound, their care costs less than chickens, ducks or geese, because in favorable locations they require but little feed from their owners as they find most of their feed in the fields, seeking dilligently for insects, grubs, weed seeds and waste grain in the fields.

Turkeys require wide range, such as they find on a farm and thousands of farmers could add very much to their incomes by rearing a flock of turkeys.

Young turkeys are reputed to be hard to raise but the truth is that they are not harder to bring up than some varieties of chickens. Some breeders use hen turkeys to hatch with while others prefer hens. The best plan perhaps is to use the first eggs of the season by hatching them under hens allowing the hen turkey to hatch the last clutch she lays.

If a flock of turkeys has been taught that they will be given feed every evening if they come home for it the birds will become accustomed to staying around home by the time winter is over and the hens will readily lay in nests close to the house if they are provided for them. A barrel with one head out, laid on its side, makes a good nesting place. Put some fine hay in the barrel and have the open end so placed that it is screened from observation and it will suit the hen very well.

A hen turkey will lay about three sets or clutches of eggs. The number laid depends on the individual capacity of the hen to produce eggs.

One mating with the male fertilizes all the eggs produced during one period of laying and one male is sufficient for a dozen hens where so many are kept.

There is a disposition to grow turkeys to the largest possible size, but when over large birds are sent to market they are not the first ones sold.

In selecting breeders choose birds as near the Standard size as it is possible to get them, looking to birds with deep breasts, thick thighs and strong bones. Every action should indicate perfect health and abundant vitality.

Of recent years much has been said about the evils of inbreeding and no doubt this talk is fully justified because inbreeding is dangerous unless the breeding stock is selected with great care.—Poultry.

### FINISHING TURKEYS.

Many breeders have the idea that it is advisable to wait until just a few days before wanted before beginning to prepare the turkeys for market.

For the past several years we begin feeding our poults for the market as soon as they are old enough to eat. This may seem as figurative language but we remember of hearing the veteran breeders that have preceded us many years say the first two months feeding of a turkey's life greatly determined the condition of the turkeys at maturity or at market time. This saying we have found to be gospel truth. It is very true we do not begin feeding them at this age a heavy fattening ration, but feed them intelligently on pure, wholesome foods in order to build up bone and muscle preparatory to heavy feeding for fattening later in the fall. The facts are we feed our turkeys but very little; but this very little served just at the right time and in the proper amounts is of more value than a large amount of feed, fed often.

June and July are the banner months with us for young turkey poults. If we can successfully tide them over those two months in a thrifty condition we feel assured of being able to market the majority of poults we enter the month of August with. Hence, the feed and management during the early part of the poult's life then really does pave the way clear for market conditions later in the season. We cannot refrain from mentioning the fact that lime is a great subjugator of lice on the poults, at the same time a prime factor in the poults digestion.

Lime or wall plaster should be placed in a crumbled condition in reach of the poults constantly. I have used lime for years and fully realize the great value of it. If you have never noticed the necessity of lime for the growing and maturing turkeys just watch them pick the whitewash from the side of a building or fence that has been whitewashed; they eagerly pick the mortar from the cracks of old log buildings or anywhere they can get it. Hence, this is sufficient evidence they need something of this nature in their daily bill of fare. We prepare it in vessels or feed troughs, same as grit or charcoal and they soon learn to eat of it same as our other farm stock eats salt. I am confident if lime is used in its various forms about the turkey quarters during the breeding and growing season the number brought to maturity will be quadrupled. Therefore as lime is inexpensive it should be used liberally as a whitewash and side dish for the turkeys of all ages. During the heated months we give special attention to the drinking water. The young growing turkeys are compelled to drink from the fountains on their arrival from a day's outing for the reason the water is disinfected with a few drops of carbolic acid in order to prevent any contagious disease securing a fatal grasp upon them. Turkeys will drink freely on arriving home from a day's ramble, even if they pass directly by a running stream of pure water, at least ours do and we do not neglect the administering of the acid for the benefit of the turkeys' health. If we keep the poults healthy while they are growing we are assured of producing turkeys that are simply "giants" and ideal specimens for breeding purposes.

It is hard for the writer to talk on the turkey question without mentioning most emphatically the importance of keeping them free from lice. Trying to raise turkeys and lice together "is like unto" raising chicks and swine together, always devoured by the enemy. In raising turkeys, if we should do all else well and overlook the lice our efforts have been in vain. Therefore if we expect to land a fine flock of turkeys for Thanksgiving or for other purposes the lice must be annihilated. No matter how well and carefully we feed them, unless we master the lice proposition the poults will never thrive. There is one more obstacle to overcome in growing turkeys and that is roup. A turkey if it once contracts roup is done for, it never will survive. Should it improve for a time it would be unfit to breed from but there isn't one turkey in a thousand that ever gets over roup. If poults are never permitted to drink water with other barnyard fowls they will hardly ever contract roup. In the fall when the overcrowded chicks begin to show signs of roup remove all possible chance for the poults to drink where the sick chicks have ever drank. Isolate the roupy chicks and feed the poults entirely away from the chicken quarters. Roup in

turkeys is worse than a forest fire. In the majority of instances not a poult will survive. Keep the turkeys separated from all other fowls at all times otherwise you will have more or less trouble in trying to raise turkeys.—Poultry.

## LEG BANDS.

A subscriber wants to know what the leg band is and of what use it is to the average poultry raiser. In reply we will quote what a poultry writer says on this subject:

"To many poultry breeders the leg band is something that has never been heard of, to say nothing of having seen it. To the breeder of pure-bred fowls it is almost a necessity. It becomes necessary to mark the various individuals so as to keep the families and the attainments of certain individuals well in mind.

"By the aid of a leg band on an individual fowl, her young can be traced to such a time that they can be equipped with leg bands and by a good system of books the pedigrees can be kept just the same as those in sheep or swine. The latter have ear tags in their ears giving their individual as well as their record number.

The leg band consists of a band that is easily fastened to the leg or shank of a fowl very much like a ring is paced on the finger. It has a secure fastener so that the hen cannot pull it off with her beak. On this band may be the initial of the breeo er and the number of the iowl which corresponds with the pedigree record kept in a book for that purpose.

"This is a sure means of identifying fowls where there is no other way of distinguishing them. In our breeding business we have found the leg band a necessity and a convenience, and we would not now know how to get along without it. The price is reasonable and they are easily obtained.

"In addition to these conveniences it will be found a convenience to know the age of fowls by the use of the leg band. It very often occurs where the band is not used that there is some doubt about the age of fowls. With the leg band it is a very easy matter."—Coleman's Rural.

## RATTLING IN THE THROAT.

Rattling in the throat is a prominent symptom of bronchitis. Isolate all afflicted fowls and begin treatment.

In the early stages of the disease give one drop of tincture of aconite in a half-teaspoonful of water.

Repeat every hour for five hours, and then once in three hours. Give a hot mash of at least one-half bran, the other half middlings or bread-crumbs.

Also slightly acidulate the drinking water with ten drops each of sulphuric and nitric acid.

In place of the aconite, a teaspoonful of glycerine and about two drops of whisky added will often allay the irritation. Repeat daily for about a week.—Farm World.

## MARKING YOUNG CHICKS.

One poultryman has a unique way of marking his chickens. As soon as they are a day or two old, he cuts off a toe just far enough back to be sure to get all the nail off, with a good sbears. It is done instantly and bleeds very little.

The chickens do not seem to mind it in the least. Care should be taken not to cut the toe too far back as it will then bleed too much.

Shiftlessness and neglect are twin brothers.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Pruning Cedars and Pines.

I have 20 cedars and pines in my front lawn, which are about thirty years old. When is the proper time to prune them without injury to the tree?—C. F., Napa.

We would defer pruning until February or March and then prune as desired. Of course the natural habit of growth is preferred with these trees, but where one wishes an opening for circulation of air or for view, it is advisable to prune at that time of the year.

### May Be Katydid Eggs.

I have lately found in my olive orchard some twigs covered with hard, thin scale, oblong in shape and about a quarter of an inch long. Can you tell me what this is?—C. S. H., Pasadena.

Without specimens or more definite description than is given here, it is impossible to hazard more than a guess. Our guess, however, would be that the "scale" are katydid eggs. We have seen more than one grower frightened at finding this insect's eggs, which overlap somewhat similar to fish scales on the limbs and look very formidable. They are harmless and most interesting to observe.

### Needs Organic Matter.

What can I do for streak of fairly dark soil which takes up water too freely and on which oranges have marbled leaves? —E. B. H., Visalia.

This query was referred to J. H. Norton in charge of the citrus experiment station at Riverside, and he answers that the only thing to do is to plow under all the organic matter possible and water oftener.

### Hedge Fence.

How can I grow tight fence around a 20-acre place. Would thorn or osage orange do well in this section? How is it best to proceed? Should plants be bought from nursery or seeds obtained?—F. G., Greenfield.

We have been unable to learn as to osage planting in this state other than that it occupies far too much ground to be considered desirable, especially where land is valuable. We would not encourage planting of any kind of hedge, but would prefer to the osage, Monterey cypress, privet or laurestina. But better than any of these is a good wire fence which takes up no room and does not require pruning, unless one wishes hedge as a wind break. The privet is not a high grower; the Monterey cypress is good, but not long lived. The plants may be secured from nurserymen.

### Transplanting Walnut Trees.

What is the best time of the year to transplant seven-year old walnut trees? Should roots and top be pruned or reset just as taken up?—W. C., Los Angeles.

It is unfortunate to have to move trees of such age, but by using care it can be done. It will be necessary to prune off the top to correspond with the portion cut from the roots. After the tree is out the roots should be given a clean cut at the tips where they have been mutilated in cutting off with the shovel, cutting preferably from the underside with a slanting upward cut. Plant as carefully as possible, tramping dirt about the roots and leaving a slight hollow about the trunk which may be filled with water to further settle the dirt. The transplanting should be done at once or at least within the next month or six weeks.

### Walnut Trouble.

I have walnut trees on Chino Ranch which were set three years ago next March. After a recent cold day I noticed that sap was running from many of the trees where the leaves had lately dropped off. The thermometer registered 25 degrees that morning. Do you think the buds were frozen enough to injure them? Is this a good location for profitable walnut raising?—P. A. F., Chino.

We can give no reason for the condition described, unless possibly it came from early drouth induced by not watering trees sufficiently in, say August, and then a later irrigation in September started sap flowing, and thus the trees were brought to the cold season unprepared for low temperatures. When trees are kept growing all summer through they are in perfect condition to meet cold weather when it comes, but if they become dormant through lack of moisture, a later flow of sap leaves them in bad condition. We would consider your section an excellent one for walnut growing, but the circumstances mentioned are sufficient to cause one to inquire as to behavior of other orchards in the same section.

### Yorkshire and Essex Hogs.

Can you give the address of anyone in this state breeding Yorkshire hogs?—W. H. R., De Luz.

Please give address of breeder of Essex hogs.—T. P. S., Dos Palos.

We are unable to give address of breeder of Yorkshire or Essex hogs. Will subscribers who know of breeders in this state kindly write this department.

### Bermuda Choking Alfalfa.

I have four acres of alfalfa almost choked out by Bermuda. I have burned off the surface and would like to know if I can get a good stand of alfalfa by disking and sowing eight or ten pounds to the acre. Of course, the Bermuda is not dead, but as it is not growing at this time of the year, I thought possibly the alfalfa might get a good start before the Bermuda commences to grow again.—C. B., Thermal.

We do not believe any success can be obtained by sowing seed on a field in such condition. By far the best way would be to plow and give one season's clean cultivation to some such crop as corn or beets, or you might plow and seed to either wheat or barley and plan to mow early and then give clean cultivation the last of the summer. After one season of this treatment the Bermuda will be sufficiently killed out to give a good stand of alfalfa.

### Fertilizer For Lemons.

Would like information in regard to fertilizing my lemon orchard. Have a surface soil of sandy loam but a few inches deep, analysis of which shows only fair amount of phosphoric acid; subsoil of adobe showing scarcely any phosphoric acid but rich in lime. Now, what system of fertilization had I better adopt to get phosphoric acid down well into the adobe? Bone meal, being insoluble, I imagine would not reach the spot and would encourage shallow rooting. Super-phosphate on the other hand is water soluble but, I understand, becomes fixed by lime in the soil—to what depth it would permeate the soil before becoming fixed by the lime is a question I would like answered.

Again will it go down further after the second rain or irrigation following the first after application, or will it then be fixed and go no further?

May say that I have grown a luxuriant cover crop the past three or four years—will this help in getting phosphoric acid down to the roots?—W. H. Harris, Chula, Wash.

This query was referred to Mr. J. H. Norton of the Citrus Experiment Station at Riverside and he writes:

I would use acid phosphate putting it in the bottom of the furrow. Plow in deep as there is no objection to so doing. The second best way of applying is to apply to the surface of the soil then plow under immediately. As to how deep this phosphate goes before being fixed I do not know, but probably not more than three or four inches at most. It will undoubtedly be fixed by the first wetting it has. Undoubtedly the roots of the cover crop do take some of the phosphoric acid down, but this will be a very slow process and even then the roots probably are not going deep, at least only a very small percentage of the roots.

This soil probably should be handled by plowing slightly deeper each year than the preceding year as long as this can be kept up without injury and is practical. This mixing of the surface and sub-soil along with cover crops and phosphates should solve the phosphate question.

### Soil Maps.

I understand that the state horticulturists have maps of the citrus growing sections of Southern California, showing and naming different kinds of soil in each plot of ground. Is this true and can these maps be had?—E. N., San Dimas.

There is a soil map issued by the Department of Agriculture at Washington, which may be secured by writing to the Division of Soils. The maps hardly contain the information you suggest, but at the same time are very valuable. In writing for them you should state township and section which you wish the maps to cover.

### Walnuts in San Jacinto Valley.

Will the Placentia Perfection do well in Hemet? Our altitude is about 1600 feet, soil rich sandy loam and very deep, climate hot in summer with scarcely any fog. Where can good trees be secured? I have seedling Santa Barbaras which I would like to have budded over to Placentia Perfections. Trees have gone through their third summer. Can you tell me where to get grafts from prolific trees? Will the Mayette or Concord do well here? At what age is a walnut tree in full bearing?

Hemet is most too far from the coast, or at least that factor combined with the summer temperature gives a condition which does not make your valley ideal for walnut producing. Our judgment would be that it would be wiser to plant such fruits as peaches, apples, pears or some other tested fruits. These mentioned can be produced of as high grade in your valley as in any place in the world.

A walnut tree five years old should bear 10 to 12 pounds, and if well cared for shoud be in good bearing at 12 years, but ought to increase until 20 years old, when it ought to bear 150 to 200 pounds per year. This cannot be expected of ordinary seedlings nor of any variety that will blight. There are some very good varieties, of which the Eureka is probably the best for this part of the state. The Mayette and Concord have not been tried under exactly your conditions, so we cannot say. The southern part of the state has not given them a trial which would justify anyone in giving positive information. The cost of grafting over trees such as you mention would not exceed 25 cents per tree. The trouble would be to secure someone qualified to do the work. The Eureka is proving one of the most blight resistant and best bearing trees in the southern part of the state. Others selected from seedlings are being proven out and probably will develop very many desirable strains.

### Tanning With Fur On.

Can you tell me how to tan calf's hide with hair on so as to make robe or rug?—R. W. E., Sanger.

Cut off the fleshy and fatty parts from the inside of the skin and soak in warm water for an hour. Spread on a paste made up of equal parts of borax and Glauber salts with water sufficient to make a thin paste. After spreading over the fleshy side of the skin, double with fleshy side inward and put in cool place. After 24 hours wash clean and smear with the following: Sal soda one ounce, borax one-half ounce, hard white soap two ounces. This should have been melted slowly and put in warm place 24 hours before using. Then apply the following: Alum eight ounces, common salt sixteen ounces, saleratus four ounces, hot rain water sufficient. When this is all dissolved and cool, place skin in it for twelve hours. When dry, repeat the soaking two or three times. Smooth the inside with sandpaper and pummice and work with the hands, as the softness and beauty of the hide depends on this last feature.

Another Formula: Soak hide so as to soften completely. If it has been allowed to dry it will require much longer than if salted and kept moist. After soaking remove the fleshy parts and put in a solution made up of one part salt, one part alum, and one quarter or one-half part japonica. This will dissolve in hot water sufficient to make a 35 degree hydrometer test. According to thickness, the hide should be left in this solution from five to ten days. Skins may then be finished in from two to three days. Thorough working, both before and after this process, softens the skin. Working down with sandpaper and otherwise is also necessary. It is impossible to have the leather soft without this long working. After working and thinning down, the skin may be again placed in the liquor for a day or two, when it may be hung up to dry. When good and hard, shave or work it down thinner and softer again and lay away in moist sawdust and later give a heavy coat of oil.

### Chrysanthemums.

Should chrysanthemums be thinned or reset to keep them thrifty and of their original size and beauty? Also, is it desirable to cut them back during the summer?—R. W. E., Sanger.

If desired to remove them from their present location, cut off nearly all of the old tops and heel in in any convenient place. Then cuttings may be taken from the young shoots as they come up in the springtime, to make next year's plants. To secure original size—if by that is meant large size often exhibited by florists—a system of summer pruning is necessary, which will be more fully treated in the garden department in the season for summer pruning. By leaving the old roots and allowing shoots to grow as they will, the most flowers are secured, but they are of small size.

### PIGEON AND BANTAM SHOW.

The Pigeon and Bantam show will be held at Chutes Park, Los Angeles, January 17 to 23, 1910. The association is offering a fine line of special premiums, including 50 silver cups. For information and premium list write J. L. Homer, 3841 S. Olive St., Los Angeles.

Prof. C. W. Woodworth of the State University is in Southern California testing out with various fumigating outfits two methods of measuring the cubic contents of the tents, or rather measuring the dosage of cyanide required. His appliances are novel and the results of the tests will be of interest.

While it is true that comb-honey brings, at wholesale, considerably more money that that which is extracted, yet the fact that a colony will produce nearly twice as much extracted honey as it will honey in the comb, makes the profit, per colony, about the same in both cases.

A million dollar smelter is to be erected at Parker, Arizona.

# San Francisco and Los Angeles Produce Markets

## Los Angeles Markets

LOS ANGELES, Dec. 29, 1909.

### Butter.

No change in butter quotations and general tone of market normal.

Produce Exchange wholesale quotations are as follows with actual selling prices to the trade 2½ advance on Extras.

Creamery per roll .....67½@75
Eastern Creamery per roll .....67½
Cooking .....26
Ladles .....26@27

### Cheese.

Northern fresh .....20
Domestic Swiss .....23
Imported Swiss .....32

### Eggs and Poultry.

Greater activity on the part of the hens has started the egg market downward. Storage supply still further reduced.

Paying price f. o. b. L. A. is:
Local candled .....45@47
Case count buying price .....42
Storage .....28@30

Dealers pay for live poultry f. o. b. L. A.
Hens per pound .....18@19
Roosters .....9@18
Roasters 3 lbs. and up .....18@19
Spring chickens .....18@20
Turkeys .....20@24
Geese .....10@12
Ducks .....10@12
Squabs .....1.25@1.75

### Live Stock.

All prices on live stock are advancing. Hogs are strong at 8c with every promise of a continuing firm market.

The following quotations are f. o. b., Los Angeles on all stock.

Hogs from 175 to 200 pounds.....8
Prime Steers .....5
Heifers .....3½@4¼
Calves per pound .....5
Sheep ewes per head.....4.00@4.25
Lambs per head.....4.00@4.25
Wethers .....4.50@5.00

### Potatoes.

Wholesale prices are:
Sweet per ctl .....1.50@1.75
Burbank local .....85@1.00

## Citrus Market

LOS ANGELES, Dec. 29, 1909.

Shipments of oranges are not being made so freely as before the Christmas trade, but a few are going from nearly all sections. Many are busy enquiring as to whether the cold weather has done any injury and all are hoping that it will be very slight. In many sections the trees are showing the injury in the nipping of all tender growth, but so far no damage to fruit can be determined. If injury appears later it is evident it will be only in spots and not as general as last year. The dropping off of holiday demand has caused slightly lower quotations to be made in most eastern markets. This decline will not amount to more than two bits per box.

Lemons are still being well received, but if the foreigns continue to arrive in present quantity it is feared that a decline will result.

**Shipments.**

Total shipments to date this season from Southern California points 1441 cars, of which 898 were oranges and 546 were lemons. To same date last year 1944 cars, of which 1339 were oranges and 606 lemons.

---

NEW YORK, Dec. 27.—Nine cars navels and four cars lemons sold, also one car Arizona navels. Market easier and somewhat lower on navels; lemons easier; Arizonas steady. Weather cloudy, cold. Bad blizzard Saturday and Sunday; heavy snow, worst in twenty years.

| NAVELS— | Avge. |

## FACTS WORTH REMEMBERING.

Mark the date on each egg when put under the hen.

Fix up the poultry house before wet weather.—Poultry Digest.

## STAMPING EGGS.

In reply to a query as to the effect of stamping dates on eggs with rubber stamp an Eastern exchange says:

We have not known of a case where the ink proved injurious. Some of the copy pad inks might prove harmful. It would be best to use the vegetable ink used on pads of meat inspectors. Any ink on shell will injure eggs for boiling for table purposes and on hard boiled eggs will be found plainly marked on the white. We prefer to keep the eggs in marked egg boxes, and to use pencil only on eggs. Do not use indelible pencil.

## HOW THE KETTLE SANG.

I wish the kettle would sing again
Just as as it used to do—
I wish it would sing of a lion slain—
Of a pirate crew on the Spanish main—
Of a clipper ship on the sea way high,
With a cabin boy and the Boy was I—
Just as it used to do.

I wish the kettle could sing again,
Just as it used to do,
Of a little girl in a bonnet red,
Saved by a prince from a hydra head
That lurked in the corn that towered high,
And the girl was She and the Prince was I—
Just as it used to do.

I wish the kettle would sing again
Just as it used to do.
I wish it would sing to war's alarms,
The booming of cannon and clash of arms—
Of a blue-clad boy where the strife ran high,
With face to the steel and willing to die—
Just as it used to do.

I wish the kettle would sing again,
Just as it used to do.
The lyrics it crooned and the tales it told—
But the hearth is chill and the years are old,
The fancies it whispered have all taken wing,
And never again the kettle will sing
Just as it used to do!

—Buffalo News.

## THREE JEWELS.

RALPH WALDO EMERSON said concerning the law of the household: "Would we codify the laws that should reign in the households, and whose daily transgressions annoy and mortify us, and degrade our household life—we must learn to adorn every day with sacrifices. Good manners are made up of petty sacrifices. Temperance, courage, love are made up of the same jewels. Listen to every prompting of honor."

There can be no abiding happiness in the home unless this law of sacrifice and unselfishness holds good with every member of the family.

It will not do for the husband and father to yield his rights as head of the family or to deny himself indiscriminately of every comfort, that life for loved ones be made easy.

Neither should his sacrifices be accepted as a matter of course and he be regarded as a mere provider of necessaries and luxuries, or simply as one who holds the purse.

The wife ought to maintain the dignity of her posiiton always. Not by words so much as by action and manner.

Unremitting attention should be given to her husband's wishes and comfort in every way, and by retaining and practising all the little arts both in dress and manner used to draw the suitor, which are so often forgotten after marriage.

A man naturally likes to see his wife becomingly attired. She is his, you know; and it is a credit and a compliment to him that she is well dressed—a flattering commentary upon his judgment in selecting a wife.

As a mother she must not forget herself so entirely that in her self-abnegation she will fail to preserve not only her own selfrespect, but the love and respect of her husband and children.

It may often require a great effort for the tired housewife to keep herself always neat and tidy, but the exertion pays. The sensation of looking well, the struggle to throw light into the face and overcome languor, all act as an inspiration and a stimulant to her conversation so that her cheerfulness influences and rebounds upon the whole family, accompanying the husband to his daily toil and the children to their studies.

The poet Keats has sung: "A babe in the house is a well-spring of pleasure;" and another writer has said: "The world is safe as long as children are born into it." Yet the home can be made decidedly uncomfortable if children are allowed to monopolize all of a parent's attention to the exclusion of the rights of others, if they are permitted to accept every benefit elders are prompted to bestow without giving anything in return.

Therefore, from earliest infancy, in justice to the child, for the sake of his or her own interests, as life must develop either for good or evil, this divine law of sacrifice should be persistently instilled into the young mind.

These three jewels—temperance, courage, love—may be likened to the precious stone selected by watchmakers, on account of its hardness and resistance to wear, to be where the pivot turns in the socket.

Temperance to be used in the appropriation of other people's self-abnegation in order that self-respect and the respect of husband and children should be maintained.

Courage in the persistent regard for the rights of others, also in the giving up of one's own desires, especially where they conflict with the comfort of other members of the family; in the laying aside of and overlooking the hastily spoken word and the unwavering demand of parents that there be a constant regard for the general good of the whole household.

Love, the greatest of these three jewels, ought to be the mainspring that governs temperance and courage. It is the resisting power upon which all motives, deeds and actions must turn. Without love the home life must be like the worn ratchet wheel of a watch and no key of temperance or courage without the lubricating oil of love, will cause the wheels of domestic peace and happiness to go round.

Therefore, every individual in the family circle should listen to the promptings of honor and take a personal interest and pride in keeping these jewels as radiant gems in the home life.—Farm World.

## NEW YEAR RESOLUTIONS.

Take your choice or all of the following for your New Year resolutions.

* * *

Rest a little, play a little,
Every passing day;
Be too wise, dear friends, to think
Of slaving life away;
Rest will fit for better work,
And play will bring good cheer;
These things count for much, you'll find,
In our sojourn here.

* * *

"I will not worry."

"I will not be afraid."

"I will not give away to anger."

"I will not yield to envy, jealousy or hatred."

"I will be kind to every man, woman and child with whom I come in contact."

"I will be cheerful and hopeful."

"I will trust in God and bravely face the future."

* * *

I will watch for opportunities of 1910 and catch them as they come.

* * *

If I have faltered more or less
In my great task of happiness;
If I have moved among my race
And shown no glorious morning face;
If beams from happy human eyes
Have moved me not; if morning skies,
Books, and my food, and summer rain
Knocked on my sullen heart in vain,
Lord, Thy most pointed pleasure take
And stab my spirit broad awake.

—Robert Louis Stevenson.

* * *

I will live within my means—and then some—during the coming year.

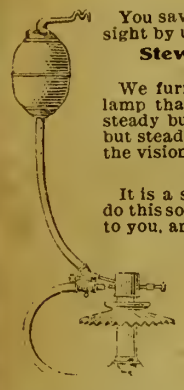
* * *

I expect to pass through this life but once. If therefore there is any

**LET THERE BE LIGHT**

**THE Stewart Gas Lamp**

SOLVES THE PROBLEM OF ECONOMY.



You save money and your eyesight by using the **Stewart Gas Lamp.**

We furnish your home with a lamp that is absolutely safe, a steady burner, no flicker, a soft but steady flame that does not tax the vision, or inflame the eye.

It is a surprising fact that we do this so cheaply, at so little cost to you, and give you a faultless, perfect effect, that electricity is not needed—is too expensive.

**THE STEWART GAS LAMP**

is built of metal and is constructed on the most simple plan. It works in detail in the line of economy.

Every farmhouse can afford it because it saves oil, ornaments any home and like the loyal hired man, works overtime, when the days are short and light is needed. Let us send you our convincing treatise on cheap superior light.

**Savings Deposits**

made between Dec. 1 and Jan. 10 will bear interest from Jan. 1, 1910

**Paid up Capital $1,000,000.00**

Accounts may be opened by mail.

**THE OLDEST SAVINGS BANK IN CALIFORNIA**

**Improved Incandescent**

**KEROSENE OIL LAMP**

Does not soot, smoke or blacken. ODORLESS, consumes HALF THE OIL of ORDINARY coal oil lamp and any quality of oil gives equally GOOD RESULTS. Costs SIXTH OF CENT AN HOUR to burn and GIVES 92 CANDLE POWER of pure WHITE LIGHT. A better and more economical light than gas or electricity at only a fraction of the cost. MANTLES and CHIMNEYS are STRONGER and more DURABLE than any ever before offered. Fits any regular lamp.

IMPROVED with patent lever for raising chimney to light lamp.

BURNER COMPLETE with full instructions $3.00 SPECIAL TERMS TO AGENTS.

Write now for territory.

**AMERICAN LAMP CO.**

314-15 San Fernando Bldg., Los Angeles, Cal.

**Our Mantle Will Fit Your Lamp**

**Wireless Telegraphy**

Now is the time to engage in the study of this new science. 1,000 operators wanted to fill positions created by U.S. government action. Salary of trained operators ranges from $15 to $40 per week.

**The Wireless Institute of California**

is the best equipped wireless school in the world for teaching this science. We are located so that our high power station is in daily conversations with all stations on the Pacific Coast. R. R. Commercial School of Telegraphy owned and operated in connection with us. We can qualify you for a position anywhere. Young men and women write for descriptive circulars.

**WIRELESS INSTITUTE OF TELEGRAPHY**

Official Training School for Wireless Telegraph Companies

**Central Trust Bldg., Van Ness Ave. cor. Golden Gate**

**SAN FRANCISCO, CAL.**

**Telegraph Operators**

**——WANTED——**

The Western Telegraph Institute and Railroad Business College, San Fernando Building, Los Angeles. Thorough, practical school devoted exclusively to preparing young men and women for railroad business. Situations waiting all graduates.

kindness I can show, or any good that I can do to any fellow-being, let me do it now; let me not defer it or neglect it for I shall not pass this way again.—A. B. Hegeman.

* * *

Take a dash of water cold
And a little leaven of prayer,
A little bit of sunshine gold
Dissolved in the morning air;
Add to your meal some merriment
And a thought for kith and kin;
And then as a prime ingredient,
A plenty of work thrown in:
But spice it all with essence of love
And a little whiff of play:
Let a wise old book and a glance above
Complete a well spent day.

* * *

To keep my health! To do my work!
To live!
To see to it I grow and gain and give!
Never to look behind me for an hour!
To wait in weakness and to walk in power;
But always fronting onward to the light,
Always and always facing toward the right;
Robbed, starved, defeated, fallen wide astray—
On, with what strength I have! Back to the way!
—Charlotte Perkins Stetson.

* * *

There is an idea abroad among moral people that they should make their neighbors good. One person I have to make good: myself. But my duty to my neighbor is much more nearly expressed by saying that I have to make him happy—if I may.—Robert Louis Stevenson.

Resolved, to live with all my might while I do live; Resolved, never to lose one moment of time, but improve it in the most profitable way I possibly can; Resolved, never to do anything which I should despise or think meanly of in another; Resolved, never to do anything out of revenge; Resolved, never to do anything which I shoud be afraid to do if it were the last hour of my life.—Jonathan Edwards.

* * *

If there be some weaker one,
Give me strength to help him on;
If a blinder soul there be,
Let me guide him nearer thee.
Make my mortal dreams come true
With the work I fain would do:
Clothe with life the weak intent,
Let me be the thing I meant;
Let me find in Thy employ
Peace that dearer is than joy;
Out of self to love be led,
And to heaven acclimated,
Until all things sweet and good
Seem my nature's habitude.
John G. Whittier.

* * *

I will renew my subscription to the California Cultivator and as it is worth much more than the dollar per year which I pay in cash, I will occasionally send in a helpful hint of some method of work, or some little economical practice, or some table or cooking suggestion which will help others to enjoy the paper more.

This last of the above resolutions I promise sacredly to keep.

### A NARSTY LOOK.

Two London cabbies were glaring at each other.

"Aw, wot's the matter with you?" demanded one.

"Nothink's the matter with me, you bloomin' idiot!"

"You gave me a narsty look," persisted the first.

"Me! Why, you certainly 'ave a narsty look, but I didn't give it to you, so 'elp me!"

---

"Now, here is a piece of goods," said the voluble saleslady, "that speaks for itself." "That's all right," rejoined the Longmont man who was doing a shopping stunt for his better half. "Now, if you will kindly keep quiet for a few minutes and give the goods an opportunity to speak, I'll be much obliged."

---

"Father," said little Rollo, "what is an egotist?"

"An egotist, my son, is a burnt match what thinks it was the whole fireworks."—Washington "Star."

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point?"

**MORE LIGHT**

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

**THE ANGLE LAMP**

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

**Boesch Lamp Co.** 1135 Mission St. San Francisco

## Business Notes

### BUILT BIG BUSINESS.

Most of us see only the present. We see success only as we are brought face to face with it today. How many of us ever look back for the cause, the vital things that make succcess possible?

That the key to real business success is often based on a sound principle, rather than money, is best illustrated by the reproduction of the following biographical sketch of Frederick Mayer, founder of the F. Mayer Boot & Shoe Company, reproduced from an issue of the German American National Alliance:

Frederick Mayer, founder of the factories at Milwaukee and Seattle now bearing his name, came to this country from Nienstein, Hessen Darmstadt, in May, 1851, and immediately proceeded to Milwaukee, Wisconsin, where he entered the employ of R. Suhm as a Journeyman shoemaker.

The spirit that prompted him to seek his fortune in the new world was soon responsible for another change, and in 1852, a year later, he embarked in business on his own accord, making boots and shoes to order as only a German apprenticed artisan knows how. Subsequently a stock of goods was carried and a retail business conducted until 1880, when the manufacture of shoes was engaged in at wholesale to the trade.

The business succeeded from the beginning and it was here that the staid qualities of German honesty and persistency, together with the knowledge of shoe making gained by a strict German apprenticeship, came to the aid of a young business destined to become a factor in the production of shoes in America, for it soon became known that the shoes manufactured by F. Mayer had qualities not ordinarily found in shoes, and business began to expand.

In 1890 the business was well established, the foundation firmly laid and the policy well determined. From that time on the growth was more rapid. Factories, additions, more factories and more additions were added, until now the plant occupies a substantial group of buildings in Milwaukee and Seattle. The capacity of the present Mayer factories at Milwaukee and Seattle is 9,000 pair per day, giving employment to an army of people, paying annually over six hundred thousand dollars in wages, and employing sixty-five salesmen who travel 24 states in the interest of Mayer shoes.

Frederick Mayer died on March 16, 1893, after building up a large and successful business. He was succeeded by his sons, George P. Mayer, Fred J. Mayer and Adam J. Mayer, who, by rigidly maintaining the policy of the founder, have succeeded in bringing the business up to its present magnitude, where it stands as a monument of German thrift and industry. Frederick Mayer was a man of strong character and amiable disposition. He believed in a square deal for everybody. He was popular and had hosts of friends, especially among the early settlers of Milwaukee, who admired him for the qualities that were responsible for his success. He was a man of simple tastes, who loved his home and believed in the strict observances of his duty to God and man. He left behind him a striking example of what has, in at least one instance, been contributed by a German to the welfare and prosperity of this great country.

The leading brands manufactured by the F. Mayer Boot & Shoe Co. are: "Honorbilt," for men; "Leading Lady" Shoes, "Martha Washington" Comfort Shoes, "Yerma" Cushion Shoes, "Special Merit" School Shoes.

### DIVIDEND NOTICE.

THE SAVINGS AND LOAN SOCIETY OF SAN FRANCISCO.
(Member of The Associated Savings Banks of San Francisco)
101 Montgomery Street, cor. Sutter St.

For the half year ending December 31, 1909, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Monday, January 3, 1910. Dividends not drawn become part of the deposit accounts and earn dividends at the same rate from January 1st. Money deposited on or before January 10, will earn interest from January 1st. WM. A. BOSTON, Cashier.

### NEW CATALOG.

The Black Minorca Club of California has issued a very attractive catalog. In this catalog are some good articles on Black Minorcas setting forth their good qualities. There are a number of illustrations of birds, also a list of the members. If you want one of these catalogs, write the Secretary, M. E. Brown, Box 100 R. D. 1, Los Angeles, Cal.

The salient article of the January Century is easily Mr. Walter Camp's chatty discussion of "Personality in Football," in which he asks and answers the pertinent question, "Are our boys trained to set up a false standard of hero-worship?" and shows at length what contributions to the real progress of the game have been made by such players and coaches as Lee McClung, Arthur Poe, John De Witt, George Chadwick, Tipton of West Point, Daly of Harvard, "and a host of others." It is a valuable and lively presentation of one of the absorbing questions of the day; and besides the photograph shown there are reprodutions in tint of three stirring drawings by Leyendecker.

**58 BROODERS FREE**

I am going to give away absolutely free 58 of the famous "SUCCESS" Brooders. I have 58 Old Trusty Incubators on hand that I wish to close out, and will give free one brooder with each order for an Old Trusty Incubator. Send today for the 148-page Catalog showing the Incubator. We have 120, 160, and 240-EGG SIZES. Prices $12.50, $16 and $20. Now is the time to get a $5 brooder free if you act quick. $2 deposit will hold any Incubator you select 30 days.

# An Extraordinary Work on Practical Farming

***Just Completed by L. H. BAILEY***
*Director of the College of Agriculture, Cornell University*

## A Complete Library of Outdoor Books in Four Volumes

This great work of Prof. Bailey's is most exceptional. We have hastened to make special arrangements with the Publishers whereby our customers may secure the complete work on unusually favorable terms, because we know that

**Everyone Interested in Growing Things Will Find It Profitable.**

No such work has ever before been published. No one man alone could possibly write so complete, authentic and practical a library on growing things; for, in addition to Prof. Bailey's own able writings, this work embraces the concentrated experiences of 300 specialists, each one of whom has been chosen as being the very highest living authority on his subject. This work is called the

**Cyclopedia of American Agriculture**

and is complete in four handsome, quarto volumes, so profusely and accurately illustrated that every part of the text is made clear enough for the veriest novice. It treats of the Planting and development of a farm, or orchard, irrigated fruit farm; up-to-date Nursery; General Truck Farm; Intensive Market Garden; Cut Flower Industry, Capital required for all, and hundreds of other important things too numerous to mention.

Besides these important matters, every subject vital to a Livestock farm or Dairy is thoroughly treated. Capital required to install a dairy, plans and directions for construction of most economical and most profitable buildings and machinery, with particular reference to sanitary Dairy stables.

**A Volume on Farm Livestock**

treats each animal separately and thoroughly. Cattle, horses, sheep, swine, poultry, and all domestic animals; how to select them, how to feed them and keep them in health, and how to breed successfully. Some of the best known experts in the country have made this volume the most practical treatise on farm stock ever published. A final volume deals in the most up-to-date manner with the sociological problems of farm life and the relation of agricultural interests to our national welfare.

**Los Angeles, California**

Northern Branch:
San Francisco, California

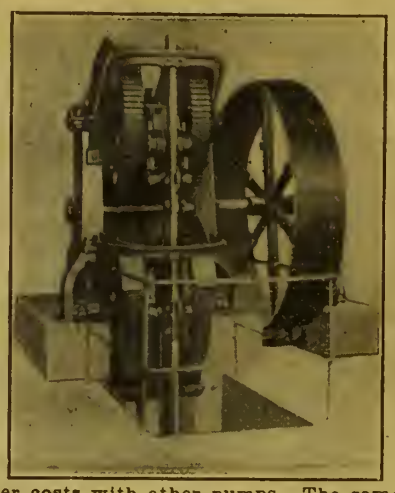
# The Smooth Running Pomona Deep Well Pump

**RELIABILITY**

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work we know and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.



**ECONOMY**

May be driven by a steam engine, gas engine or electric motor, and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbitted and will last a lifetime with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Send for illustrated catalogue to—
